

MOTIVATION AND LEARNING

Lecture : 21

Motivation

- ✓ Motivation is what causes a person wants to know, act, understand, believe or gain particular skills.
- ✓ Motivation is seen as a mental impulse that drives and directs human behavior, including learning behavior.
- ✓ Motivation has a willingness to activate, mobilize, channel and direct the attitudes and behavior of a learner.
- ✓ It's an internal process that can't be directly observed in the situation but which are real, nevertheless, and which serve to activate, guide and maintain people's actions.

The Major Components of Motivation

Activation

Intensity

Persistence

verywell

<https://www.verywellmind.com/what-is-motivation-2795378>

Definition of Motivation

- The term “**motivation**” comes from the **Latin root “movers”** means to move
- Refers to the **process of arousing the movement** through the release of energy among organisms/human beings
- Hebb – “**Motivation refers** to a) **the existence of organized phase sequence/s**, b) **the direction and content**, c) **the persistence in given direction or stability of content**”
- Atkinson – “**Motivation refers to the arousal of tendency to act to produce one or more effects**”

❑ Motivation is the underlying reason/s of our behavior, the trait / attribute that moves us to do or not to do something (Guay et al; 2010)

❑ Types of Motivation: Intrinsic and Extrinsic Motivation

- Locus of causality: can be either **intrinsic/internal** or **extrinsic/external**
- Personal factors such as needs, interests, curiosity or self – satisfaction then we call it **intrinsic motivation**
- If the **causal factors** lie in the external environment like rewards, **social pressure**, punishment, **financial gain** etc. it's called **extrinsic motivation**

✓ Exmpl.:

1. When an individual does something purely for getting monetary benefits/incentives/rewards - **Extrinsic motivation**

2. If a student voluntarily participates in any teamwork/activity/workshop out of curiosity/personal interest- **Intrinsic motivation**

- Motivation can fall anywhere on the **continuum** from **amotivation** (lack of intent to act), to **extrinsic motivation** (intention to gain something or avoid punishment), to **introjected regulation** (doing something /behaving well because one feels pressure from within), to **identified regulation** (realizing the value of developing a skill/behavior);
- finally to **intrinsic motivation** (behavior purely guided/motivated by internal satisfaction/inherent benefits)

- Both **intrinsic motivation** as well as **identified regulation** (highest forms of Motivation : **Self – Determination Theory**, (2000)
- **Exmpl.** – Children who have high intrinsic motivation are more likely to demonstrate strong conceptual learning, good memory and high overall school achievement, and better self – confidence than their peers
- **Intrinsic motivation** is considered to be **more crucial** for students as it is associated with **deep learning, better performance** and **self-efficacy** compared to extrinsic motivation
- **Extrinsic motivation** can be changed into intrinsic motivation developing on the task and learning environment

MOTIVATION AND LEARNING

Lecture : 22

Theories of motivation

- Drive theory
- Arousal theory
- Expectancy theory
- Goal setting theory

Types of Motivators

Intrinsic

- autonomy
- belonging
- curiosity
- love
- learning
- mastery
- meaning
- ...

Extrinsic

- badges
- competition
- fear of failure
- fear of punishment
- gold stars
- money
- points
- rewards
- ...

Drive Reduction Theory

Clark Hall

Drive theory

Drive Reduction The
Need

Satisfaction

- Drive theory is a psychological concept that attempts to explain why and how people behave in the ways they do.
- It focuses on the idea of drives, which are urges or motivations that drive people to take action.
- There are three primary types of drives: biological, psychological, and social.
- The theory was created by behaviorist Clark Hull in 1943.
- Hull proposed that there are three primary drives that drive human behavior: the drive for food, the drive for sex, and the drive for social interaction.
- These drives, he argued, are what drive people to take action and engage in various behaviors.
- Hull's work was influential in the field of psychology, but has evolved over the years with many different versions of this theory .

FOUR DRIVE THEORY

• Types of Drive-

- **Biological drives** are those that are related to our **basic needs to survive** and reproduce, such as the need for food, water, shelter, and sex.
- These drives are often referred to as “**primary drives**” because they are necessary for survival.
- **Psychological drives** are those that are related to our **psychological needs, such as the need for love, attention**, and approval.
- These drives are often referred to as “**secondary drives**” because they are not necessary for survival; these are important for our **psychological well-being**.
- **Social drives** are those that are related to our **need for social interaction**.
- These drives are often referred to as “**tertiary drives**” because they are **not necessary for survival or psychological well-being**; they are important for our social lives.

Drive theory

- There are a variety of different theories that are related to drive theory.
- **Incentive Theory**
- Incentive theory is a theory that suggests that people are motivated to take action in order to receive a reward.
- This theory is based on the idea of operant conditioning, which is a type of learning that occurs as a consequence of the consequences of our actions.
- In operant conditioning, there are three primary types of reinforcement: positive reinforcement, negative reinforcement, and punishment.
- Positive reinforcement is a type of reinforcement that rewards behavior.
- Doing so increases the likelihood of that behavior being repeated. For example, if you give a child a toy after they eat their dinner, you are using positive reinforcement to increase the likelihood that the child will eat their dinner in the future.

Motivation

- Drive-Reduction Theory
 - the idea that a physiological need creates an aroused tension state (a drive) that motivates an organism to satisfy the need

- **Negative reinforcement** is a type of reinforcement that **removes an unpleasant condition** after the desired behavior is displayed.
- For example, if you take away a child's toy after they eat their dinner, you are using negative reinforcement to increase the likelihood that the child will eat their dinner in the future.
- **Punishment** is a type of reinforcement that **involves bringing an unpleasant consequence** after a behavior is displayed.
- For example, if you spank a child after they eat their dinner, you are using punishment to decrease the likelihood that the child will eat their dinner in the future.
- <https://egyankosh.ac.in/bitstream/123456789/23799/1/Unit-1.pdf>

Drive Reduction Theory

Arousal Theory

- A theory of motivation suggesting that human beings seek an optimal level of arousal not minimal level of arousal.

- The **Arousal Theory of Motivation** suggests that one's levels of arousal play an important role in determining one's level of motivation.
- This theory states that individuals are motivated to seek out stimulation when they have low levels of arousal, but will become bored and unmotivated when they become too highly aroused (APA).
- The Arousal Theory of Motivation was first proposed by **Henry Murray in 1938**.
- Murray's theory was based on his observations of humans' needs for achievement, power, and affiliation.
- He believed that these needs were motivated by a desire to reduce one's levels of arousal.
- The Arousal Theory of Motivation has been further developed over the years by other psychologists, such as **Robert Zajonc (1965)** and **John Atkinson (1957)**.

ACCORDING TO THIS THEORY, WE ARE MOTIVATED TO MAINTAIN AN OPTIMAL LEVEL OF AROUSAL.

Yerkes Dodson Law

- What Is Optimal Arousal?
- How does this explain our friend who wants to go clubbing every night of the week and our roommate who gets overwhelmed by going to a bar once?
- Well, everyone's arousal levels are different.
- According to psychologists, this theory is extremely personal and may even vary over the course of a person's life.
- Hence, it might even change with changes in our mood.
- Either way, the cravings we have to eat or the sudden desire we have to head to the gym and burn off a bunch of calories may both be explained by the arousal theory of motivation.
- **High- and Low-Arousal Activities**
- The activities that increase or decrease our level of arousal may be personal as well – but in general, stimulating and challenging activities are considered “high-arousal.”

The Yerkes-Dodson Law: Inverted U-Model

Expectancy Theory

- This theory suggests that motivation is not primarily a matter of being pushed from within by various urges or drives; rather it is more a question of being pulled from without by expectations of attaining desired outcomes.

- **Expectancy Theory** basically states that a person behaves the way they do because they are motivated to select that behavior ahead of others because of what they expect the result of that behavior to be.
- Expectancy Theory of Motivation was developed by **Victor H. Vroom in 1964** and extended by **Porter and Lawler in 1968**.
- The theory is based on the **assumption** that our behavior is based on making a conscious choice from a set of possible alternative behaviors.
- According to Expectancy Theory, the behavior we choose will always be the one that maximizes our pleasure and minimizes our pain.
- **1. Expectancy**
- Expectancy is the belief that if we work hard (effort) we will be able to hit the targets (performance) that have been set for us by our manager/mentor.

Expectancy theory

MOTIVATION AND LEARNING

Lecture : 23

- We make this judgment based on a number of factors, including:
- Our past experience.
- Our confidence in our ability.
- How difficult we perceive the target is to achieve, and whether or not the target is under our control.
- An example of expectancy is thinking, “If I work hard I can achieve the targets my boss has set for me”.
- **2. Instrumentality**
- In this variable, we’re assessing how likely we are to receive a reward if we hit the targets that have been set for us.
- Again, we make this judgment based on a number of factors, including:
- Is the relationship clear between performance and reward (outcome).
- How transparent is the decision-making process around who gets what reward?

Basic Expectancy Model

A person is motivated to the degree that he or she believes that (a) effort will lead to acceptable performance (expectancy), (b) performance will be rewarded (instrumentality), and (c) the value of the rewards is highly positive (valence)

- An example of instrumentality is thinking, “If I achieve all of the targets set for me then I believe I will get promoted”.
- **3. Valence**
- So far we have a goal to hit and we understand the reward we’ll get if we hit it.
- The final piece of the motivation puzzle is valence.
- Valence is simply the perceived value of the reward to you.
- This could be negative if we actively want to avoid the reward, zero if we are unmotivated by the reward, or one if we’re motivated by the reward.
- When it comes to valency , an employee will have to weigh up the pros and cons,
- Example, -
 - “Do I want to be promoted?
 - Will the extra work result in even less time with my family?
 - Is it really worth putting in a serious effort for a whole year to receive a promotion and a 10% pay rise?”

Motivation

Goal Setting Theory

- The view that motivation can be strongly influenced by goals
- Specific
- Attainable
- Challenging

- Goal-setting is the process of establishing clear and usable targets, or objectives, for learning.
- Edwin Locke's goal-setting theory argues that for **goal-setting to be successful** with desired outcomes, they **must contain the following** specific points (Lunenberg & Samaras, 2011):
 - **Clarity**: goals need to be specific;
 - **Challenging**: goals must be difficult yet attainable;
 - **Goals must be accepted**;
 - **Feedback** must be provided on goal attainment;
 - **Goals are more effective** when they are used to evaluate the performance;
 - **Deadlines** improve the effectiveness of goals;
 - **A learning goal orientation** leads to higher performance than a performance goal orientation;
 - **Group goal-setting** is as important as individual goal-setting.

- The acronym **SMART** can help us recall what the most important attributes of effective goal-setting are:

- Specific
- Measurable
- Assignable
- Realistic
- Time-based

- Goal-setting theory is based on the idea that **setting specific and measurable goals is more effective** than setting unclear goals.
- **Application of the goal-setting theory-**
- **Clarity:** Goals must be clear and specific for the employees to achieve the organizational targets;
- **Challenge:** Goals should be sufficiently challenging to keep employees engaged and focused

- **Commitment:** Employees need to understand , support and committed **to the goal**;
- **Feedback:** Feedback is an important component **to ensure tasks stay on track to reach the goal**.
- **Task complexity:** Goals **should be broken down into smaller goals**.

Figure 1
A Model of Goal-Setting Theory

(Adapted from Locke and Latham, 2002)

Theories of Motivation

Theory of motivation	Key assumptions	Strengths and weaknesses
Drive theory	Biological needs produce unpleasant states of arousal which people seek to reduce	People sometimes try to increase their drives, not reduce them
Arousal theory	Arousal (general level of activation) varies throughout the day and can motivate many forms of behaviour; people seek optimal arousal, not low arousal	Arousal is only one of many factors that influence motivation behaviour
Expectancy theory	Behaviour is “pulled” by expectations of desired outcomes rather than “pushed” from within by biologically based drives.	Focus on cognitive processes in motivation is consistent with modern psychology; widely used to explain work motivation
Goal-setting theory	Setting specific and challenging but attainable goals can boost motivation and performance, especially when individuals are committed to reaching the goals and receive feedback on their progress	Goal setting is highly effective in increasing performance, but mechanisms that explain these effects are still somewhat uncertain

MOTIVATION AND LEARNING

Lecture : 24

Maslow's Need Hierarchy Theory

Maslow's Hierarchy of Needs

- Maslow's hierarchy of needs is a motivational theory in psychology comprising of a five-tier model of human needs,
- From the bottom of the hierarchy upwards, the needs are: physiological (food and clothing), safety (job security), love and belonging needs (friendship), esteem, and self-actualization.
- Needs lower down in the hierarchy must be satisfied before individuals can attend to higher needs.
- Motivation is seen as being not just concerned with tension reduction and survival but also with human growth and development.
- This five-stage model can be divided into deficiency needs and growth needs.
- The first four levels are often referred to as deficiency needs (D-needs), and the top level is known as growth or being needs (B-needs).

Maslow's need hierarchy Theory

- **Deficiency needs** are concerned with **basic survival** and includes **physiological needs** (such as the need for food, and sleep) and safety needs (such as the need for security and freedom from danger).
- **Behaviors associated** with these needs are **seen as 'deficiency' motivated**, as they are a means to an end.
- Deficiency needs **arise due to deprivation** and are said to motivate people when they are unmet.
- **Growth needs** are more **psychological needs** and are associated with the realization of an individual's full potential and the need to 'self-actualize'.
- These needs are **achieved more through intellectual and creative behaviors**.

Self-Determination Theory (SDT)

(Ryan & Deci, 2000)

Figure 1. The Hierarchical Model of Intrinsic and Extrinsic Motivation. From *Toward a Hierarchical Model of Intrinsic and Extrinsic Motivation*, by R. J. Vallerand, 1995, June. A theory/review paper presented at the Canadian Psychology Association annual conference, Charlottetown, Prince Edward Island, Canada.

- **Self-Determination Theory**, or **SDT**, links personality, human motivation, and optimal functioning.
- It posits that there are two main types of motivation—**intrinsic** and **extrinsic**—and that both are powerful forces in shaping who we are and how we behave (Deci & Ryan, 2008).
- For types of motivation **SDT differentiates between autonomous motivation** and **controlled motivation**.
- **Autonomous motivation** includes motivation that **comes from internal sources** and includes motivation from extrinsic sources for individuals who identify with an **activity's value** and how it aligns with their **sense of self**.
- **Controlled motivation** is comprised of **external regulation**—a type of motivation where an individual acts out of the desire for **external rewards** or **fear of punishment**.

SELF DETERMINATION THEORY
Female Infographic

- **Introjected regulation** is motivation from “partially internalized activities and values” such as avoiding shame, seeking approval, and protecting the ego.
- When an individual is driven by **autonomous motivation**, they may feel **self-directed** and autonomous;
- when the individual is driven by **controlled motivation**, they may **feel pressure** to behave in a certain way, and thus, experience little to no autonomy (Ryan & Deci, 2008).
- In **identified regulation**, the motivation is somewhat internal and based on conscious values and that which is personally important to the individual.
- **Extrinsic motivation** is **integrated regulation**, in which intrinsic sources and the desire to be self-aware are guiding an individual’s behavior.
- Human beings are very complex ,thus, it is useful to think of **motivation on a continuum** ranging from “**non-self-determined to self-determined.**”

Self-Determination Theory

True Intrinsic Motivation	Pursues behavior for the pleasure of knowing, the pleasure of accomplishment or the pleasure of stimulation.
Integrated Regulation	Pursues behavior because they symbolize what is important to the person's sense of worth.
Identified Regulation	Pursues behavior because the outcomes are valued as important to the person's personal goals.
Introjected Regulation	Pursues behavior because of an internalized guilt -related sense of ought or should.
External Regulation	Pursues behavior for pay or reward or because of coercion.
Amotivation	Does not pursue behavior because success is unlikely or impossible - there is no point in trying.

The Self-Determination Continuum

Nonself-Determined

Self-Determined

(Based on Ryan, R.M. & Deci, E.L. (2000). *Self-Determination Theory and the Facilitation of Intrinsic Motivation, Social Development, and Well-Being*. *American Psychologist*. 55(1), 68-78.)

Self- Determination Theory

- Self-determination refers to a person's ability to make choices and manage their own life.
- SDT suggests that people can become self-determined when their needs for competence, connection, and autonomy are fulfilled.
- SDT seeks to explain how being self-determined impacts motivation—that people feel more motivated to take action when they think that what they do will have an effect on the outcome.
- It states that people are motivated to grow and change by three innate (and universal) psychological needs.
- The concept of intrinsic motivation, or engaging in activities for the inherent reward of the behavior itself, plays an important role in this theory.

❑ Self – determination Theory: (Deci & Ryan, 2000)

- To strengthen our intrinsic motivation three basic psychological needs are to be fulfilled-
- a) autonomy, b) competence and c) relatedness
- **Autonomy** need makes us feel that we are carrying out the task/s of our own choice, not being forced by others
- The **competence** need makes us feel capable of learning the course materials (self-efficacy)
- The need for **relatedness** makes us feel connected to fellow pupils, teachers, colleagues, peers etc. and gives us a sense of belongingness

MOTIVATION AND LEARNING

Lecture : 25

- ✓ “Autonomy – supportive teaching –learning process” satisfies these needs , stimulates intrinsic & self – determined motivation among students
- ✓ Learning environment makes the students feel autonomous, and competent and also supported by teachers fostering relatedness
- ✓ Both types of motivation (Intrinsic or Extrinsic) are regarded as the drive/force to achieve targets and to maintain that rigor to complete cognitive behavior like planning, organization, decision making etc.
- ✓ Combination of both is required for achieving and realizing the full potential of the individuals, otherwise known as “achievement motivation”

Self-Determination Theory

• Achievement Motivation-

- Achievement motivation is defined as **the need for achievement** and is an important **determinant of aspiration, effort, and persistence** when an individual expects that his performance will be evaluated in relation to some **standard of excellence**.
- The concept of achievement motivation dates back to the forties where various works on success and failure along with ego-involvement provided the early foundation for what would become **John W. Atkinson's Achievement Motivation Theory (AMT)** in 1966.
- AMT explains the **integral relationship between an individual's characteristics and their need to achieve something in life**.
- It also takes into account the kind of competitive drive a person has to achieve and set goals.

Four steps to achievement:
Plan purposefully,
Prepare prayerfully,
Proceed positively,
Pursue persistently.

~ William Arthur Ward

~rishikajain.com

- The **presence of internal and external factors, which play a role in motivation.**
- The theory explains that the motivation one has to achieve something in life is closely **governed by these factors.** **Example-**
- **Internal:** willingness, determination, punctuality, personal drive;
- **External** (also known as environmental factors): pressures, expectations, targets (set by organizations, members of the family, or society).
- **Extrinsic motivation** – an external incentive to engage in a specific activity, especially motivation arising from the expectation of punishment or reward.
- **Intrinsic motivation** – an incentive to engage in a specific activity that derives from pleasure in the activity itself rather than because of any external benefits that might be obtained.

- Achievement motivation stems from two separate needs. One is the **motivation to achieve** and is related to one's desire to accomplish successful goals, and the other is the **motive to avoid failure**;
- Some individuals are **hesitant** to take on the responsibilities of having to accomplish goals or employ in activities because they are afraid to fail.
- The **motive to avoid failure** includes worries about the consequences of failing, **self-criticism**, and diversion of attention, accelerated heart rate, or nervousness, which can all lead to poor performance.
- In contrast, those who feel the **need to achieve successful goals are more motivated to persist at goals they know they can accomplish**, which means that your **achievement-oriented behavior** is influenced by the strength of your tendency to achieve success.

ACHIEVEMENT

"Playing it safe is the riskiest choice we can ever make."

~Sarah Ban Breathnach

- According to **Achievement Motivation Theory**, a person's **need to achieve something** and the reason behind his/her overall motivation **to achieve a certain goal**, more often than not, comes from within and is strongly related to the **individual's need for power** and **affiliation**.

Achievement Motivation Theory

- McClelland, et al. stated that achievement motivation, or the need for achievement comes from internal and external factors.
- Highly motivated people have three different needs: achievement, affiliation, and power.
- Most people have a mix of these needs.

THANK YOU!
