Kharagpur

Lecture : 51

- **Social cognition** refers to a complex **set of mental abilities** underlying **social stimulus perception, processing, interpretation,** and response.
- **Social cognition** is the **cognitive processes** that influence social behavior.
- Together, these abilities support the **development of adequate social competence** and **adaptation**.
- **Social cognition** has a protracted development through infancy to adulthood.
- **Social stimuli** require individuals to acquire and **fine-tune a large range of abilities** over the course of development allowing them to **perceive, recognize, process, interpret,** and **respond to** often subtle, multiple, contradictory, and **changing social cues**.
- Together, the refinement of these diverse abilities **contributes to an individual's social competence across the lifespan**.

- **Smooth** and **adaptive social interactions** depend on the recruitment of virtually all core cognitive functions (**e.g., perception, attention, language, memory, executive functions**) as well as more specific mental abilities referred to as “**social cognition**.”
- **Social cognition** is an umbrella term defined as “the **ability to recognize, manipulate and behave with respect to socially relevant information** (... and) requires neural systems that process perception of social signals and that connect such perception to motivation, emotion, and adaptive behavior.” (Adolphs , 2001).
- **Social cognition** includes relatively basic abilities, such as face processing and joint attention, and more complex ones, such as theory of mind, moral reasoning, and social decision-making (Kilford et al., 2016).
- Some **conceptualizations of social cognition** further distinguish between abilities involved in affective (“**hot**”; **e.g., facial expression processing**) vs cognitive (“**cold**”; **e.g., understanding cognitive mental states such as beliefs and intentions**) processing (Etchepare & Prouteau, 2017).

- **What Is Social Cognition?**
- **Social cognition** refers to the different **psychological processes** that influence how people process, interpret, and **respond to social signals**.
- These processes allow people to **understand social behavior and respond** in ways that are appropriate and beneficial.
- **Social cognition** encompasses a **range of processes**.
- The processes involved in perceiving other people and **how we learn about the people in the world around us**.
- The study of the mental processes involved in **perceiving, remembering, thinking about, and attending to** the other people in our social world.
- The reasons we attend to certain information about the social world, **how it is stored in memory, and how it is used to interact with other people**.

- Social schemas refer to people's mental representations of social patterns and norms.
- These representations can include information about societal roles and the expectations of different individuals within a group.
- Using a social-cognitive perspective, researchers can study a wide range of topics, including:
 - Attitudes
 - Person perception
 - Prejudice
 - Stereotypes
 - Self-concept
 - Discrimination
 - Persuasion
 - Decision-making

- Development of Social Cognition
- Social cognition develops in childhood and adolescence.
- As children grow, they become more aware not only of their own feelings, thoughts, and motives but also of the emotions and mental states of others.
- Children become more adept at understanding how others feel, learning how to respond in social situations, engaging in prosocial behaviors, and taking the perspective of others.
- According to Piaget, a child's cognitive development goes through several stages.
- During the earliest stages of development, children are very egocentric.
- They see the world from their own perspective and struggle to think about how other people may view the world.
- As children grow older, children become increasingly adept at perspective-taking and have an increased ability to think about how and why people act the way they do in social situations.

Learning & Social Cognition

Prof. Atasi Mohanty

Lecture : 52

- Recently, research has provided evidence that children develop the ability to think about other people's perspectives at an earlier age;
- One of the most important developments in the early emergence of social cognition is the growth of a theory of mind.
- A **theory of mind** refers to a **person's ability to understand and think about the mental states of other people**.
- It is the emergence of a **theory of mind** that is **critical to being able to consider the thoughts, motives, desires, needs, feelings, and experiences that other people may have**.
- Being able to think about how these mental states can influence **how people act is critical to forming social impressions** and explaining how and why people do the things that they do.
- **Cultural Differences in Social Cognition-**
- Social psychologists have also found that there are often important **cultural differences in social cognition**.

- When looking at a social situation, **any two people may have wildly different interpretations.**
- Each **person brings a unique background of experiences, knowledge, social influences, feelings, and cultural variations.**
- **Collective cultural influences** can also **affect how people interpret social situations.**
- The same social behavior in one cultural setting might have a very different meaning and interpretation if it were to occur or be observed in another culture.
- As people interpret behavior, extract meaning from the interaction, and then act based upon their beliefs about the situation, they are then further reinforcing and reproducing the cultural norms that influence their social cognitions.
- **Our perceptions of others play such an important role in how we forge relationships, how we interact with others, how we treat others, and how others treat us.**

- Focusing on the collective and interactive aspects of human thought may provide a better understanding of **how people think about** and **understand social behavior**.
- Learning more about this perspective offers insights into **how other people shape our behaviors and choices**.
- It also plays a role in understanding **how individual cognitions affect how we perceive and respond to others**.
- Social psychologists & researchers have put these questions:
- How do we develop attitudes? What role do these attitudes play in our social lives?
- How do we interpret other people's feelings and emotions? How do we figure out what they are thinking or feeling? What cues or indicators do we use to make these assumptions?
- How is self-concept formed and how does it influence our relationships with others?
- What influence do our thoughts have on our feelings?
- What mental processes influence person perception, or how we form impressions of other people?

- How We Learn From the Behavior of Others ?
- **Social Cognitive Theory-**
- Social cognitive theory is a learning theory developed by the renowned Stanford psychology professor **Albert Bandura**.
- The theory provides a framework for understanding how **people actively shape** and **are shaped by their environment**.
- The theory details the processes of **observational learning** and **modeling**, and the **influence of self-efficacy** on the production of behavior.
- The theory **views people as active agents** who both influence and are influenced by their environment.
- A major component is **observational learning**: the **process of learning desirable** and undesirable behaviors by observing others, then **reproducing learned behaviors** in order to maximize rewards.
- **Individuals' beliefs in their own self-efficacy** influences whether or not they will reproduce an **observed behavior**.

Social Cognitive Theory

- Bandura does not consider himself a Social Learning Theorist, but prefers Social Cognitive Theory
- Comprehensive theory that includes motivational and self regulatory mechanisms
- Emphasizes the social origins of human thought process and behavior
- Emphasizes cognitive influence on behavior, rather than conditioning influences from the environment

(Boeree, 1998)

- One assumption of social learning is that we learn new behaviors by observing the behavior of others and the consequences of their behavior.
- If the behavior is rewarded (positive or negative reinforcement) we are likely to imitate it however if the behavior is punished imitation is less likely.
- Social cognitive theory has been used to explain a wide range of human behavior, ranging from positive to negative social behaviors such as aggression, substance abuse, and mental health problems.
- Social cognitive theory views people as active agents who can both influence and are influenced by their environment.
- The theory is an extension of social learning that includes the effects of cognitive processes — such as conceptions, judgment, and motivation — on an individual's behavior and on the environment that influences them.

- It argues that people actively influence their learning by interpreting the outcomes of their action, which, in turn, affects their environments and personal factors, informing and altering subsequent behavior (Schunk, 2012).
- Bandura highlights the role of observational learning and imitation in human behavior;
- The central tenet of Bandura's social-cognitive theory is that people seek to develop a sense of agency and exert control over the important events in their lives.
- This sense of agency and control is affected by factors such as self-efficacy, outcome expectations, goals, and self-evaluation (Schunk, 2012).
- Bandura's perspective has been applied to a wide range of topics, such as personality development and functioning, the understanding and treatment of psychological disorders, organizational training programs, education, health promotion strategies, advertising and marketing, and more.

SOCIAL COGNITIVE THEORY

Determines Human Behavior

Learning & Social Cognition

Lecture : 53

• Observational Learning

- A major component of social cognitive theory is observational learning.
- Bandura claimed that observational learning, through which people observe and imitate models they encounter in their environment, enables people to acquire information much more quickly.
- Observational learning occurs through a sequence of four processes:
- **Attentional processes** account for the information that is selected for observation in the environment.
- People might select to observe real-life models or models they encounter via media.
- The person must first pay attention to the model.
- **Retention processes** involve remembering the observed information so it can be successfully recalled and reconstructed later.

- The observer must be able to remember the behavior that has been observed.
- One way of increasing this is using the technique of rehearsal.
- **Production processes** reconstruct the memories of the observations so what was learned can be applied in appropriate situations.
- This is the ability to replicate the behavior that the model has just demonstrated.
- The observer has to be able to replicate the action,
- Often the observer will replicate the observed action , will modify the behavior to produce a variation that fits the context.
- **Motivational processes** determine whether or not an observed behavior is performed based on whether that behavior was observed to result in desired or adverse outcomes for the model.
- If an observed behavior was rewarded, the observer will be more motivated to reproduce it later.
- However, if a behavior was punished in some way, the observer would be less motivated to reproduce it.
- Thus, social cognitive theory cautions that people don't perform every behavior they learn through modeling.

- Many behaviors can be learned, at least partly, through modeling;
- Much research indicate that children become more aggressive when they observed aggressive or violent models.
- Moral thinking and moral behavior are influenced by observation and modeling.
- This includes moral judgments regarding right and wrong which can in part, develop through modeling.
- Bandura identified three basic models of observational learning:
- A live model, which involves an actual individual demonstrating or acting out a behavior.
- A symbolic model, which involves real or fictional characters displaying behaviors in books, films, television programs, or online media.
- A verbal instructional model, which involves descriptions and explanations of a behavior.

- Cognitive social learning theory was adopted from social cognitive theory.
- Bandura (2001b) indicates that human behavior is explained generally by unidirectional view such as by environmental influences or by internal dispositions.
- Social cognitive theory, however, follows triadic reciprocal causation for human functioning.
- In this transactional point of view, personal, behavioral, and environmental determinants operate bi-directionally (Fig. 1).

Social Cognitive Theory

- Through his research, Bandura observed that components of learning occur through observation and modeling behaviors
- This concept led to the theoretical framework of the social cognitive learning theory (Famous People Info, 2011).

Social Learning. Fig. 1

 [figure 1_374](#)

Schematization of triadic reciprocal causation in the causal model of social cognitive theory (Bandura 2001b)

- **Reciprocal determinism** is one of the key terms of social learning in which **our behavior, personal factors, and environmental factors** all influence each other.
- In contrast to **environmental determinism**, **behavior** is the result of interaction results between prior learning and **present environmental conditions**.
- According to **social cognitive approach**, **society** and **personal interactions** have influences on behavior as well as social learning.
- Bandura assigns **people has an active role** rather than passive recipients throughout **self-reinforcement mechanisms of learning**.

Figure 3.1 Reciprocal Determinism

- People are self-organizing, proactive, self-reflecting, and self-regulating organisms rather than being shaped only by intrinsic and extrinsic forces.
- Symbolizing capability, self-regulatory capability, self-reflective capability, and vicarious capability of people together enable social learning and modeling via complex cognitive mechanisms.
- Bandura's modeling process is operated by four sub-processes. attention, retention, reproduction, and motivation (reinforcement).
- Social Cognitive Theory posits that people are not simply shaped by that environment; they are active participants in their environment.
- Social learning theory emphasizes that behavior, personal factors, and environmental factors are all equal, interlocking determinants of each other (Bandura,1977a).

- **Effects of modeling on behavior:**
- **Modeling** teaches new behaviors.
- Modeling **influences the frequency** of previously learned behaviors.
- Modeling may encourage previously forbidden behaviors.
- Modeling **increases the frequency of similar behaviors**.
- **Self efficacy:**
- People are more likely to engage in certain behaviors **when they believe they are capable of** executing those behaviors successfully.
- This means that they will **have high self-efficacy**.
- In **layman's terms** self-efficacy could be looked **as self confidence** towards learning.
- **Mediating cognitive factors** are **internal mental processes** that lie between the stimulus and response.
- In Social Learning Theory, these are the **factors that affect** whether learners **identify with models, imitate them** and how they **respond to reinforcement**.

- **Cognitive factors in Social learning:**
- Social learning theory has **cognitive factors** as well as **behaviorist factors** (actually operant factors).
- 1. **Learning without performance:** Bandura makes a distinction between **learning through observation** and the **actual imitation of what has been learned**.
- 2. **Cognitive processing during learning:** Social learning theorists contend that **attention is a critical factor in learning**.
- 3. **Expectations:** As a result of being reinforced, **people form expectations about the consequences** that future behaviors are likely to bring.
- They **expect certain behaviors to bring reinforcements** and others to bring punishment.
- The **learner needs to be aware** however, of the response reinforcements and response punishment.
- **Reinforcement increases a response** only **when the learner is aware of that connection;**

COGNITIVE FACTORS IN SOCIAL LEARNING

- ❑ Learning without performance
- ❑ Cognitive processing during learning
- ❑ Expectations
- ❑ Reciprocal causation
- ❑ Modeling

- 4. **Reciprocal causation**: Bandura proposed that **behavior can influence both the environment and the person**.
- In fact each of these three variables, **the person, the behavior, and the environment can have an influence on each other**.
- 5. **Modeling**: There are different types of models.
- There is the **live model**, and actual person demonstrating the behavior.
- There can also be a **symbolic model**, which can be a person or action portrayed in some other medium, , such as television, videotape, computer programs.
- The goal of **Social Cognitive Theory/SCT** is to explain **how people regulate their behavior through control and reinforcement to achieve goal-directed behavior** that can be maintained over time;
- **Reciprocal Determinism** - This is the **central concept of SCT**; refers to the **dynamic and reciprocal interaction of person (individual with a set of learned experiences), environment (external social context), and behavior (responses to stimuli to achieve goals)**.

- **Behavioral Capability** - This refers to a person's actual ability to perform a behavior through essential knowledge and skills.
- In order to successfully perform a behavior, a person must know what to do and how to do it.
- People learn from the consequences of their behavior, which also affects the environment in which they live.
- **Observational Learning** - This asserts that people can witness and observe a behavior conducted by others, and then reproduce those actions.
- This is often exhibited through "modeling" of behaviors.
- If individuals see successful demonstration of a behavior, they can also complete the behavior successfully.
- **Reinforcements** - This refers to the internal or external responses to a person's behavior that affect the likelihood of continuing or discontinuing the behavior.
- Reinforcements can be self-initiated or in the environment, and reinforcements can be positive or negative.
- This is the construct of SCT that most closely ties to the reciprocal relationship between behavior and environment.

Lecture : 54

- **Expectations** - This refers to the **anticipated consequences of a person's behavior**.
- **Outcome expectations can be health-related or not health-related.**
- **People anticipate the consequences of their actions before engaging in the behavior**, and these anticipated consequences can influence successful completion of the behavior.
- **Expectations derive largely from previous experience.**
- **Expectancies focus on the value that is placed on the outcome and are subjective to the individual.**
- **Self-efficacy** - This refers to the level of a person's confidence in his or her ability to successfully perform a behavior.
- **Self-efficacy is unique to SCT** although other theories have **added this construct** at later dates, such as the **Theory of Planned Behavior**.
- **Self-efficacy is influenced by a person's specific capabilities** and other individual factors, as well as by **environmental factors** (barriers and facilitators).

- Mental States Are Important to Learning-
- External, environmental reinforcement was not the only factor to influence learning and behavior.
- Reinforcement does not always come from outside sources.
- Your own mental state and motivation play an important role in determining whether a behavior is learned or not.
- Intrinsic reinforcement as a form of internal rewards, such as pride, satisfaction, and a sense of accomplishment.
- In many cases, learning can be seen immediately when the new behavior is displayed.
- But sometimes we are able to learn things even though that learning might not be immediately obvious.
- Observational learning demonstrates that people can learn new information without demonstrating new behaviors.
- Social learning theory has had important implications in the field of education, such as role modeling, mentoring, coaching, counselling, guidance etc.

Fig. 1 The Cognitive-Affective-Social Theory of Learning in digital Environments (CASTLE) with emphasis on the mediation of social processes on selection, organization, integration, and retrieval processes. The CASTLE is based on the Cognitive-Affective Theory of Learning with Media according to Moreno (2006)

- Combining Cognitive and Social Processes during Learning in Digital Environments-
- Social constructivist theory (Vygotzky 1978) assumes that knowledge is mainly formed in social interactions and a specific socio-cultural environment.
- Social processes triggered by social cues mediate the cognitive processing of information when learning with digital materials(Cognitive-Affective-Social Theory on digital Learning Environments ,CASTLE; see Fig. 1 above).
- Based on these theories, learning can be defined as all social interactions leading to the acquirement of experience (Vygotzky and Kozulin 1989).
- According to Bandura's theory, digital learning environments can function as this environmental factor influencing learning processes affecting learners.
- According to the socially situated cognition theory learning cannot be studied by focusing only on the isolated cognitive functions, such as attention and perception, mental model building, or memorization, but on the interplay between own behavior, the behavior of others, and environmental resources (Semin et al. 2012).

- Individual learning can be influenced by social cues in digital technologies leading to the following hypothesis:
- **Activation Hypothesis:** Social cues activate social schemata and trigger social processes.
- **Social Cue Strength Hypothesis:** The strength of social cues to activate social schemata is moderated by the modality of the learning material, the temporal changeability of information, as well as the degree of interactivity of a learning material.
- **Cognitive Influence Hypothesis:** Social processes influence how information is selected, organized, integrated, and retrieved.
- **Interaction Hypothesis:** Social processes influence and are influenced by motivational, emotional, and metacognitive processes.
- **Schema Influence Hypothesis:** How strong and fast social schemata are activated depends on the strength and number of the social cue as well as the degree of development of the social schemata.
- **Social mediation hypothesis:** Social processes triggered by social cues mediate the cognitive processing of information when learning with digital materials.

- An increased perception of **social presence** can **lead to an increased task performance in multimedia learning** environments—a phenomenon called **social facilitation** (Seitchik et al. 2017).
- Not only the interaction between humans but also the **interaction between humans** and **digitally presented learning materials** is **primarily social**.
- The **social reactions of learners to digitally presented learning materials are** not only common but also **unavoidable** (Lee and Nass 2003).
- In learning contexts, **feedback** is defined as all information provided to learners related to their actual state of learning and/or their learning outcome (Narciss, 2008) and, thus, **affect not only the cognitive processing of information but also a learner's self-concept**.
- **Piaget's conception of cognitive conflict** views information inconsistent with an individual's cognitive structures as an initiator **for assimilation** and **accommodation processes** (Piaget 1977).

- When the information is assigned to a (digital) social entity, the **perceived conflict may** have a social as well as a cognitive component and thus **be socio-cognitive in nature**, which may trigger various forms of conflict regulation (e.g., **epistemic, competitive-relational, protective-relational**; Butera et al. 2019) and **learning-relevant processes** according to the **CASTLE**.
- Social Processes by Interacting with Dynamic Learning Materials-
- Recent research stated that stronger (**para**-)social processes lead to **higher learning outcomes** when learning **with instructional videos** (Beege et al. 2019).
- The Special Case of Pedagogical Agent-
- Pedagogical agents are computer-generated or designed characters that serve instructional purposes in educational settings (Martha and Santoso 2019).
- According to Schroeder and Gotch (2015), **pedagogical agents can demonstrate tasks, can coach the learner during knowledge acquisition, can be an information source**, and/or can act as a test administrator.
- Thus, there are various **potential influences of agents on learning**.

- Feedback can be seen as a social cue triggering social comparison processes and also have an impact on, for example, self-awareness and self-schemata ;
- Elaborated feedback let learners experience digital agents as a more authentic and credible learning companion (Lin et al. 2013);
- This activates learners' social schema and promotes an interaction with the computer environment and learning process.
- Social cues may not only focus learners' attention but help them model favorable behavior by imitation.
- Perceived social cues about other learners' behavioral patterns and/or recommendations within digital social learning environments can potentially foster indirect or direct social navigation .
- Even very simple social cues can lead to social processes being activated in digital learning materials.
- Thus, the creation of learning material can be supported and the knowledge of human learning processes deepened;
- Introduction is of central importance that the influence of social processes while learning with digital materials

Why is Peer Feedback Important?

- Social validation
- Scalability
- Peer-based learning
- Spurs critical thinking

• Self- Efficacy:

- Self-efficacy is a person's belief in their ability to complete a task or achieve a goal.
- It encompasses a person's confidence in themselves to control their behavior, exert an influence over their environment, and stay motivated in the pursuit of their goal.
- People can have self-efficacy in different situations and domains, such as school, work, relationships, and other important areas.
- The concept of self-efficacy is central to Albert Bandura's social cognitive theory, which emphasizes the role of observational learning, social experience, and reciprocal determinism in personality development.
- According to Bandura, self-efficacy is part of the self-system comprised of a person's attitudes, abilities, and cognitive skills.
- This system plays a major role in how we perceive and respond to different situations.

Social Cognitive Theory

SELF-EFFICACY

Believing oneself capable of successfully performing certain behaviors or reaching certain goals

Crucial to motivation

Learners more apt to initiate, exert effort in, and persist at activities for which they have high S.E.

Comes from past successes in an activity

(to a degree)

Social factors can boost S.E.

encouraging words

successful peer models

- Our belief in our own ability to succeed plays a role in **how we think, how we act, and how we feel about our place in the world.**
- Individual's self-efficacy **plays a major role in how goals, tasks, and challenges are approached.**
- People with a strong sense of self-efficacy:
- Develop a **deeper interest in the activities** in which they participate
- Form a **stronger sense of commitment** to their interests and activities
- **Recover quickly from setbacks** and disappointments
- **View challenging problems as tasks to be mastered**
- Self-Efficacy vs. Self-Esteem vs. Self-Confidence:
- **What is the difference between self-efficacy and self-esteem?**
- **Is self-efficacy the same as self-confidence?**

- **Self-efficacy** refers to how we feel about our ability to succeed in different situations, while self-esteem refers to our respect for our own value and worth.
- **Self-confidence** is more general and refers to a person's overall belief in themselves in all contexts.
- **Self-efficacy** is more specific and context-dependent.
- A person can have high self-efficacy in one area (such as in academics) and low self-efficacy in other areas (such as in sports).
- Research suggests that **self-efficacy predicts self-esteem**.
- People with high self-efficacy also tend to have high self-esteem and vice versa.
- We begin to **form our sense of self-efficacy in early childhood by dealing with various experiences, tasks, and situations**.
- The growth of **self-efficacy continues to evolve throughout life** as people acquire new skills, experiences, and understanding.

- Bandura identified four major sources of self-efficacy.
- **Mastery Experiences**
 - The most effective way of developing a strong sense of efficacy is through mastery experiences;
 - Performing a task successfully strengthens our sense of self-efficacy;
- **Social Modeling**
 - Witnessing other people successfully completing a task is another important source of self-efficacy.
- **Social Persuasion**
 - People could be persuaded to believe that they have the skills and capabilities to succeed.
- **Psychological Responses**
 - Our own responses and emotional reactions to situations also play an important role in self-efficacy.
 - Moods, emotional states, physical reactions, and stress levels can all impact how a person feels about their personal abilities in a particular situation.

- By learning **how to minimize stress** and **elevate mood** when facing difficult or challenging tasks, people can improve their sense of self-efficacy.
- **Individuals with high self-efficacy look at difficulties as challenges** rather than threats, they tend to be more intrinsically interested in the tasks they pursue.
- **Learned helplessness** is the **opposite of self-efficacy**.
- It can occur **when people feel they have no power to control what happens in a situation**.
- Instead of looking for opportunities to change the outcome, **they give up and behave passively**.
- Self-efficacy is a psychological skill that we can foster and strengthen by celebrating our success, observing others' achievements, seeking positive affirmations from friends, and looking for ways to manage our thoughts and emotions about what we are trying to accomplish.

- There are **three key sources of self-efficacy**.
- The most powerful determinant of self-efficacy is **enactive self-mastery**, followed by **role-modelling**, and then **verbal persuasion**.
- **Enactive self-mastery** is achieved **when people experience success at performing** at least portions of a task.
- **Role-modelling** occurs **when people observe others perform a task that they are attempting to learn** or visualize themselves performing successfully.
- **Verbal persuasion** builds self-efficacy **when respected managers/teachers encourage and praise individuals/students for their competence** and ability to improve their effectiveness.
- **Positive self-talk** can also raise self-efficacy.
- **Self-regulation**-refers to an **individual's "self-generated thoughts, feelings, and actions that are systematically designed to affect one's learning"** (Schunk & Zimmerman, 2007)

- Self-efficacy and motivation are deeply entwined, but are two separate constructs.
- Self-efficacy is based on an individual's belief in their own capacity to achieve, while motivation is based on the individual's desire to achieve.
- Those with high self-efficacy often have high motivation and vice versa;
- Those with a high level of self-efficacy are not only more likely to succeed, but they are also more likely to bounce back and recover from failure.
- This is the ability at the heart of resilience, and it is greatly impacted by self-efficacy.
- Self-efficacy and confidence can work in a positive cycle;
- The more confident a person is in his abilities, the more likely he is to succeed, which provides him with experiences to develop his self-efficacy.
- Measuring self-efficacy with scales and questionnaires - General/Generalized Self-Efficacy Scale (GSE)

Manager Actions

Employees Experience

Figure 1 Managerial Actions That Improve Employees' Performance by Building Their Self-Efficacy

Source: Adapted from Heslin (1999)

• Social Perception

- It is the ability of people to create an impression about others or form a judgment about other individuals or groups.
- Drawing conclusions about a person from certain observations can also come under social perception.
- It relates to the way people think and give meaning to other people: how they form impressions, draw conclusions and try to explain the behavior of others, sometimes called social cognition.
- It is the study of how people form impressions and make inferences about other people as sovereign personalities, where they learn about the feelings and emotions of others by collecting the information they gather from physical appearance, verbal and non-verbal communication.
- Facial expressions, tone of voice, hand gestures, and body position or movement are just a few examples of ways that people communicate without words.

- There are **four main components**: observation, attribution, integration, and confirmation.
- Observation
- Observations serve **as raw data of social perception, an interaction of three sources: people, situations and behavior**, these sources are used as evidence to support a person's impression or inference about others, in order to gather supporting evidence an initial impression.
- People – physical influence
- Although society tries to train people not to judge others for their physical traits, as social perceivers, we cannot help being influenced by hair, skin color, height, weight, style of clothing, tone of voice, etc., **making a first impression**.
- People have a tendency to judge others by associating certain facial features with specific personality types .
- Example, studies indicate that people are perceived as stronger, more assertive, and competent if they have small eyes, low eyebrows, an angled chin, wrinkled skin, and a small forehead. Whereas baby-faced people tend to be connected to helplessness and harmlessness.

- Situations – context of experiences
- People are able to easily predict the sequences or outcomes of an event based on the scope and depth of their past experiences with a similar event.
- The ability to anticipate the outcomes of a situation is also highly influenced by an individual's cultural background, as this inevitably shapes the types of experiences.
- Situational observations lead humans to have pre-established notions about certain events or to explain the causes of human behaviors.
- Behaviors – non-verbal communication
- Non-verbal communication helps people express their emotions , attitudes and personalities, the most dominant form of non-verbal communication is the use of facial expressions to channel different emotions.
- Attribution
- The idea of social perception rests primarily on the quality of attribution.
- It helps us in understanding how and why people behave the way they do. Reasoning is the simplest form of attribution.

- People make attributions to understand the world around them **in order to look for reasons for the particular behavior** of an individual, they can make **judgments about what was the cause** or causes of a certain behavior.
- It is to express the personality of an individual as the source or **cause of their behavior** during an event or situation, to fully **understand the impact of personal or situational attributions**, social perceivers must integrate all available information into a unified impression.
- To finally confirm these impressions, people try to **understand, find, and create information in the form of various biases**, most importantly that social perception is determined by an individual's motivations, emotions, and cognitive carrying capacity.
- With the observations drawn from people, situations and behaviors, the next step is **to make inferences to identify the internal dispositions of an individual**.

- **Integration**
- Unless instant judgment is made by observing people, situations, or behaviors, **people integrate dispositions to form impressions.**
- Information integration theory states that **impressions are made from the personal dispositions of the perceiver** and a weighted **average of the characteristics of the target individual** (Anderson, 1981).
- The differences between the perceivers are due to the fact that **people use themselves as a standard or frame of reference when judging or evaluating others**, they tend to see that their own abilities and traits are favorable for others to have them as well, these Impressions formed on others can be influenced by the current and temporary mood of the perceiver.
- A concept called, **priming also affects a perceiver's impressions of others**, priming is the **tendency for newly perceived or implemented concepts or words to become easy and influence the understanding of new information.**
- Trait information also affects people's impressions of others, such as **there are central traits** that are those **that exert a strong effect on the general impressions of the perceiver.**

• Accuracy of social perception

- The **precision of social perception has been called sensitivity and empathy**, if this perception becomes imprecise, working and living together would be difficult, to be successful in society, one's social perception must be accurate.
- Studies show that **groups that make an accurate perception of social behavior are more efficient** than groups made up of members with a less precise perception.
- Similarly, in a small group, the **leader's accurate perception of his co-workers increases effectiveness**, society gives greater acceptance to those who make accurate and effective perceptions of individuals in society and their behavior.
- If a person makes a wrong perception of people, society does not like it.
- Social perception comes from the study of social and interpersonal behavior and is linked to effective social behavior.
- **Competence in interpersonal behavior helps to participate more effectively in group activity and discussion**, when precisely perceived qualities of group members are relevant to activities only accurate social perception leads to an increase in interpersonal relationship , competition and group efficiency.

- Our attitudes, judgments, and opinions connect cognition, emotion, and action.
- The Johari Window Model to Practice Self-Awareness & Achieve Success.
- The Johari Window was developed by American Psychologists **Joseph Luft** and **Harry Ingham** in 1955.
- The model is divided into 4 quadrants that represent your self-awareness and awareness from others.
- 1) Arena
- The **Arena is the area which is known to all.**
- You are open about your thoughts and feelings, you are aware of your behaviors and have an understanding of your skills and capabilities.
- Others that you are interacting with are aligned and understand your thoughts and feelings that you are communicating, either verbally or non-verbally.
- They also have visibility and awareness around your skills and capabilities or other knowledge or information.

- 2) Facade
- The **Facade** is the area that is known to yourself but is hidden from others.
- There may be some things that you know or are thinking in your head, or you may feel a particular way, however you decide to conceal this information and not share it with others.
- You may know that you have certain skills or abilities, but choose to not show this to others.
- Those around you do not know what you are experiencing in terms of thoughts and feelings, and may not know of your capabilities. It is hidden from them.
- 3) Blind Spot
- The **Blind Spot** is the area that is known to others but not to yourself.
- There may be behaviors that you are exhibiting or things that you are communicating that are affecting others in a particular way.

- You may be unaware or perceive yourself as not having the ability to perform in a certain situation.
- However, those that you are interacting with can see exactly how you feel or know from your behavior or prior experience that you do have skills and abilities to perform in a particular situation.
- 4) Unknown
- The **Unknown is the area that is blind to both yourself and to those around you.**
- There may be things about yourself that you do not know, such as your own skills and abilities, even your own thoughts and feelings.
- Others around you might also have no visibility or knowledge of these.
- Every single one of us acts and behaves within all four quadrants;
- We are all open and honest and aware of our skillsets and abilities, however we all hold back information from others as well.

- There are always things that other people are aware of that we do not know.
- People react to things differently and people have different perspectives, even when experiencing the same situation.
- We don't know everything, and others that are more experienced can help us with our blind spots.
- We all have our 'unknown' areas.
- We don't know what we don't know, but we can certainly make choices to test our limits and help us discover more about ourselves.
- **1. Identify Your Personal Characteristics –**
 - Also, ask one or more of your colleagues to choose the adjectives that they feel best describe you; draw a Johari Window diagram, and fill in the quadrants as follows:
 - **Open Area:** write the adjectives that both you and your colleagues chose.
 - **Hidden Area:** write the adjectives that only you chose.
 - **Blind Area:** write the adjectives that only your colleagues chose.
 - **Unknown Area:** write the adjectives that were not chosen by any of you, but that you are prompted to consider as your self-awareness increases.

- The 55 Adjectives of the Johari Window

able	accepting	adaptable	bold	brave	calm	caring
cheerful	clever	complex	confident	dependable	dignified	energetic
extroverted	friendly	giving	happy	helpful	idealistic	independent
ingenious	intelligent	introverted	kind	knowledgeable	logical	loving
mature	modest	nervous	observant	organized	patient	powerful
proud	quiet	reflective	relaxed	religious	responsive	searching
self-assertive	self-conscious	sensible	sentimental	shy	silly	spontaneous
sympathetic	tense	trustworthy	warm	wise	witty	

2. Define Your Goal – look at your completed Johari Window, and think about how you can increase your Open Area and reduce the other quadrants.

For example, if you tend to be secretive, you may want to reduce the size of your Hidden Area. Or, if you're surprised by what your colleagues think about you, you might want to minimize your Blind Area.

- **3. Open Up and Ask For Feedback** – to minimize your Hidden and Unknown areas, you need to reveal more about yourself.
- **Self-disclosure** is a give-and-take process of sharing information with other people.
- The **more that you share your thoughts, feelings and opinions**, the more your Open Area expands vertically and shrinks your Hidden Area, and the more people will likely trust you.
- To reduce the size of your Blind or Unknown areas, you need to **improve your self-awareness by seeking and accepting feedback**.

THE JOHARI WINDOW: EXPANDING YOUR SELF-AWARENESS

HOW TO EXPAND YOUR ARENA

- The Johari window's primary function is to help individuals develop an awareness of themselves, and it operates by using two important processes: disclosure and feedback.
- Disclosure requires individuals to engage in self-disclosure of thoughts and feelings to a relational partner, but also to pursue disclosure facilitation in their relational partner (such that the relational partner feels safe enough to reveal their thoughts and feelings).
- Feedback requires individuals to invite or solicit feedback from others in order to enhance self-knowledge, as well as to provide feedback to others to enhance their knowledge too.
- This process of giving and receiving allows individuals within any type of interpersonal relationship to identify blind spots and support each other's personal growth.
- Leaders with higher self-awareness tend to be more successful and achieve better outcomes, including performance metrics (Ashley & Reiter-Palmon, 2012).

- Self-awareness and communication enjoy a symbiotic relationship, where improvement in one often garners improvement in the other.
- Building self-awareness, Improving communication & Improving teamwork are the 3 major goals of Johari Window Model,
- **Benefits of Social cognitive Learning**
- Social cognition is essential for successful human interaction and comprises processes relevant for understanding others' emotions, perspectives, and mental states in order to interpret, explain, and predict the behavior of others.
- Social learning (Conte & Paolucci ,2001) is a “phenomenon by means of which a given agent (**the learning agent**) updates its own knowledge base (**adding to, or removing from it a given information, or modifying an existing representation**) by perceiving the positive or negative effects of any given event undergone or actively produced by another agent on a state of the world which the learning agent has as a goal.”

Cognitive Social-Learning Theory

- Developed by Albert Bandura
 - (Research on aggressive behavior: [BoBo Doll Study](#))
- Focus is on the importance of environmental influences on behavior and the cognitive processes that accompany
- Combines the principles of learning with an emphasis on human interactions in social settings

- Specifically, there exist at least **two types of social learning**: facilitation and imitation.
- **Facilitation involves observing the features** and behaviors of a social conspecific and its environment **to acquire novel information** that can be used to update an observer's knowledge base.
- Social learning theory considers **how both environmental and cognitive factors interact to influence human learning** and behavior.
- Behavior is learned from the environment through the process of observational learning.
- Bandura (1977) believes humans are active [information processors](#) and think about the relationship between their behavior and its consequences.
- [Observational learning](#) could not occur unless cognitive processes were at work. These mental factors mediate/ intervene in the learning process to determine whether a new response is acquired.

- The social learning approach takes thought processes into account and acknowledges the role that they play in deciding if a behavior is to be imitated or not.
- It helps us understand **how our environment** and the **people around us shape our behavior**.
- It helps explain **how individuals develop new skills and behaviors by paying attention to the behavior of others** and then **trying to reproduce that behavior** themselves.

Social Learning Theory

- Social cognition, the mental activity that relates to social activities and helps us meet the goal of understanding and predicting the behavior of ourselves and others.
- A fundamental part of social cognition involves *learning—the relatively permanent change in knowledge that is acquired through experience*.
- A good part of **our learning and our judgments of other people operates out of our awareness**—we are profoundly affected by things that we do not know are influencing us.
- But **we also consciously think about and analyze our lives and our relationships with others**, seeking out the best ways to fulfill our goals and aspirations.
- The **role of cognition is vital in our everyday life**; we consider the ways that people use their cognitive abilities to make good decisions and to inform their behavior in a useful and accurate way.
- We have a general tendency to take shortcuts through the use of **cognitive heuristics**: *information-processing rules of thumb that enable us to think in ways that are quick and easy*.
- Although our cognitive abilities are “good enough,” there are definitely some things we could do better.

Thank You
