

Psychology of Learning

Lecture - 1

Prof. Atasi Mohanty
Indian Institute of Technology
Kharagpur

➤ Introduction to Psychology of Learning

- **Learning** has been a central topic in psychological research since the inception of psychology as an independent science (e.g., Ebbinghaus, 1885/1962; Thorndike, 1911).
- The psychology of learning focuses on **how people learn and how they interact with the environments in which they learn**.
- Learning can be defined in many ways, but most psychologists agree that it is a **relatively permanent change in behavior that results from experience**.
- **Learning as a change in behaviour vs. a determinant of changes in behaviour**
- Learning involves some **kind of change** in the organism, which is necessary **but not sufficient for observing a change in behaviour**.

- Learning as an **enduring change in the mechanisms of behavior**
- Learning as the **contiguous causal effect of experience** on behavior
- Learning can be defined **as changes in the behavior** of an organism that are **the result of regularities** in the environment of that organism
- In order **to say that learning has occurred**, **two conditions must be met**:
- An **observable change in behavior** must occur during the lifetime of the organism.
- The change in behavior must be due to regularities in the environment.
- **Learning is thus seen as an effect**—that is, as an observable change in behavior that is attributed to an element in the environment (a regularity in the environment).

- **Non-associative learning** refers to a **decrease in the intensity of a response** as the result of the repeated presentation of a stimulus
- Functional definitions promote the development of cognitive learning theories
- **Cognitive definitions of learning** are mechanistic & refer to a **specific change** in the organism, a change **in mental constructs** (e.g., knowledge, representations, associations)—that can function as a contiguous cause of changes in behaviour,
- **Learning changes the physical structure of the brain** through the process of continuous interactions between the learner and the external environment.

❑ THE LEARNING ENVIRONMENT MAKES A DIFFERENCE

- People learn by making sense of the environment and of stimuli around them , the nature of the tasks confronted, the ways in which information is presented, and the expectations for the **learner's involvement**, all impact the learning process
- **Reinforcements** from the environment and the nature of feedback from significant others can stimulate or undermine greater effort

❑ LEARNING IS BASED ON ASSOCIATIONS

- People make **connections** and draw conclusions based on a sense of what they already know and have experienced
- For learning to occur, facts, **concepts** and **ideas** must also be stored, connected to other facts, concepts, and ideas, and built upon

Psychology of Learning

Lecture - 2

Prof. Atasi Mohanty
Indian Institute of Technology
Kharagpur

❑ LEARNING OCCURS IN CULTURAL AND SOCIAL CONTEXTS

- Culture influences the **knowledge** and **experiences** people bring to the classroom, the ways in which they communicate, the expectations that have for how learning will occur
- The **social context** created within the classroom—the ways in which communication, teachers' and students' roles, and opportunities for collaboration are structured—all influence the learner's understanding and construction of knowledge

❑ PEOPLE LEARN IN DIFFERENT WAYS

- Learners also possess **inter- and intrapersonal intelligence/s**, musical, kinesthetic, and spatial abilities beyond the linguistic and logical-mathematical abilities

❑ PEOPLE THINK ABOUT THEIR OWN LEARNING, AND THEIR FEELINGS MATTER-

- Both **thoughts** and **emotions** shape the learning process

• History of the Psychology of Learning

- One of the first thinkers to study how learning influences behavior was psychologist [John B. Watson](#), who suggested in his work '*Psychology as the Behaviorist Views It*' that all behaviors are a result of the learning process.
- Psychology, the behaviorists believed, should be the **scientific study of observable, measurable behavior**. Watson's work included the famous [Little Albert experiment](#) in which he conditioned a small child to fear a white rat.
- **Behaviorism dominated psychology** for much of the early 20th century.
- Although behavioral approaches remain important today, the latter part of the century was marked by the **emergence of humanistic psychology, biological psychology, and [cognitive psychology](#)**.

LEARNING THEORIES AND
INTEGRATION MODELS

- Psychology of Learning provides necessary theoretical and empirical data regarding the learning process.
- It describes the principles of learning, motivation strategies, transfer of learning, memory, retention and forgetting.
- It is also useful in understanding the fundamental problems or emotional development motivation, social behavior and personality of people.
- To sum up, learning can be described as a process by which an individual:
 - i. acquires a novel idea or experience to a situation;
 - ii. retains and applies the idea, skills and knowledge in solving the confronting problems;
 - iii. modify one's behavior by the experience gained in the past and making the change permanent.

Figure 1: A model of the learning process

What state is the learner in?

Behaviorism
Scientific Psychology should focus on **observable behavior**.

John Watson (1878-1958)

the Science of Behavior

Mental Processes cannot be studied directly

Stimulus Response Psychology

Ivan Pavlov

This block contains a collage of images and text related to behaviorism. It includes a portrait of John Watson (1878-1958) with the text 'Behaviorism' and 'Scientific Psychology should focus on observable behavior.' Below this is a yellow banner with 'the Science of Behavior'. To the right is a portrait of Ivan Pavlov with the text 'Mental Processes cannot be studied directly'. In the center is a cartoon of a rat with the text 'Stimulus Response Psychology' and a red arrow pointing to it. The background of this section features faint illustrations of people and a globe.

Unconscious | *Conscious* (of a need to learn a specific skill or knowledge)

Incompetent

Unconsciousin
competence

Consciousinco
mpetence

Competent

Unconscious
competence

Consciousco
mpetence

(relative to a
specific skill
or knowledge)

The state of “conscious incompetence” may be valuable
at the start of a learning experience.

What is Effective Learning?

Effective Learning ... that reflective activity which enables the learner to draw upon previous experience to understand and evaluate the present, so as to shape future action and formulate new knowledge

Criteria of learning-

- Learning involves change
- Learning endures over time
- Learning occurs through experience

Learning is:

- an activity of construction,
- handled with (or in the context of) others,
- driven by learner's agency

Effective learning is- all of these at their best, PLUS the monitoring and review of whether approaches and strategies are proving effective for the particular goals and context

Psychology of Learning

Lecture - 3

*Prof. Atasi Mohanty
Indian Institute of Technology
Kharagpur*

Outcomes of effective learning

- 1- more connected knowledge
- 2- wider range of strategies
- 3- greater complexity of understanding
- 4- enhanced action appropriate to goals and context
- 5- increased engagement and self-direction
- 6- more reflective approach
- 7- more positive emotions and affiliation to learning
- 8- more developed vision of future self as a learner
- 9- greater facility in learning with others
- 10- more sense of participation in a knowledge community

• Learning About Learning

- reviewing how we learn most effectively
- exploring our thinking and problem-solving
- reviewing beliefs about successes
- exploring approaches to anxiety-provoking tasks
- managing feelings that impede learning
- practising our approach to difficult tasks, talking ourselves through them
- examining responses to experiences of failure
- analysing contributions to group tasks

• How do students think and learn?

❑ **Principle 1-** Students' beliefs or perceptions about intelligence and ability affect their cognitive functioning and learning;

- intelligence and ability can be developed through effort and experiences with applying different strategies

❑ **Principle 2-** What students already know affects their learning;

- learning consists of either adding to existing student knowledge, known as *conceptual growth*, or *transforming* or revising student knowledge, known as *conceptual change*;

Principle 3- Students' cognitive development and learning are not limited by general stages of development;

❑ **Principle 4** -Learning is based on context, so generalizing learning to new contexts is not spontaneous but instead needs to be facilitated;

Psychology of Learning

Lecture - 4

Prof. Atasi Mohanty
Indian Institute of Technology
Kharagpur

- **Principle 4** - Learning is based on context, so generalizing learning to new contexts is not spontaneous but instead needs to be facilitated;
- **Deliberate practice** involves **attention, rehearsal**, and **repetition** over time & leads to new knowledge or skills that can later be developed into more complex knowledge and skills
- **Principle 5**- Acquiring long-term knowledge and skill is largely dependent on **practice**
- **Principle 6**- Clear, explanatory, and timely feedback to students is important for learning
- Learning can be increased when students receive **regular, specific, explanatory, and timely feedback** on their work

➤ **Principle 7-** Students' **self-regulation** assists learning, and self-regulatory skills can be enhanced, specifically through direct instruction, modelling, support, and classroom organization and structure

❑ **Principle 8-** Student **creativity** can be fostered by making it an important outcome of the learning process for students and educators.

❑ **What motivates students?**

❑ **Principle 9-** Students tend to enjoy learning and to do better when they are more intrinsically rather than extrinsically motivated to achieve by developing increasing competence, the knowledge and skills

❑ **Principle 10-** Students persist in the face of challenging tasks and process information more deeply when they adopt **mastery goals** rather than **performance goals**.

❑ **Principle 11-** Setting goals that are **short term** (proximal), **specific**, and **moderately challenging** enhances motivation more than establishing goals that are long term (distal), general, and overly challenging ;

➤ should learn to become intermediate risk takers

❑ **Principle 12-** Learning is situated within multiple social contexts

❑ **Principle 13-** Emotional well-being influences educational performance, learning, and development

• **How to assess student progress?**

❑ **Principle 14-** **Formative** and **summative assessments** are both important and useful but require different approaches and interpretations

❑ **Principle 15-** Students' skills, knowledge, and abilities are best measured with assessment processes grounded in psychological science with well-defined standards for quality and fairness

Psychology of Learning

Lecture - 5

***Prof. Atasi Mohanty
Indian Institute of Technology
Kharagpur***

Types of human learning

- **Non-associative learning-** is the simplest and most elementary of all, since only one element is necessary for the subject to learn something: a stimulus.
- **1- Habituation**
 - Habituation is the decrease in the response that an organism gives to a stimulus to which it is exposed in numerous trials or occasions.
 - This decrease in the response rate is presumably due to the poor biological relevance of the stimulus in question ; Example- ticking of a Wall Clock.
- **2- Sensitization**
 - Sensitization can be understood as the phenomenon opposed to habituation; That is, because of repeated exposure of a subject to a stimulus, it will increase its response rate. Example- drugs/cocaine that sensitize the individual who ingests them.

- **Associative learning-** is the type of learning where the learner has to associate two or more elements.
- Example-instrumental conditioning or learning through associating two events.
- **3- Meaningful learning**
 - According to the American theorist David Ausubel , the type of learning in which a student relates the new information to the one he already has, adjusting and reconstructing both information in this process.
 - Significant learning occurs when new information is connected to a preexisting relevant concept in the cognitive structure.

4- Cooperative Learning

- It is an **interactive learning** that organizes the activities within the classroom to become a social and academic experience.
- Special emphasis is placed here on **exchanges of information** as a way of enriching work and the confluence of ideas.
- John Dewey, promoted the importance of **building knowledge within the classroom** based on interaction and so-called **peer support**.
- For **Example**-new ideas, concepts, and propositions can be learned significantly to the extent that other relevant ideas, concepts, or propositions are sufficiently clear, and function as a point of anchoring the former.

- The information that is being **learned** is constantly subjected to a **recycling process**;
- **meaningful learning** is not excluded preconceived ideas, but it is, to also dismantle these from the **new information** that we are collecting and to which we are seeing the **meaning and the logic**.
- This learning emphasizes the importance of **knowing how to relate concepts**, rather than memorize .
- **Cooperative learning is shaped by three crucial elements:**
 - – The formation of **heterogeneous groups**, where the creation of a group identity derived from mutual aid should be promoted.
 - – **Positive interdependence**, fostering **effective communication** and **feedback** among group members.

- **Individual responsibility**, understood as the value of each member of the group separately.
- **5- Emotional learning**
 - It uses **stimuli with great affective load** to produce some change in the behavior of the subject.
 - More than in didactic means or in the classroom, this particular type of **learning becomes especially useful in the clinic**. Example of EL is therapy against phobias;
 - In **systematic desensitization**, the subject, through the **directed imagination**, is presented situations that for him have **special affective connotation** and **great emotional load**, all with the aim of enhancing learning in the most effective way possible.

- **6-Observational learning**

- **Albert Bandura** stated that another way of learning a behavior is by watching another subject doing it.
- If the **observer realizes** that the task that the observed is performing is beneficial or has **positive consequences**, it will be more **likely to issue it**.
- We all **learn observationally on a daily basis** and almost without realizing it, and this type of learning is also called social because it is necessary the relationship between two people so that it is unleashed.

- **7- Learning by discovery**

- Jerome Bruner promulgated the so-called **learning by discovery**.
- This is a new way of learning in which the student, was not given any instructions on how to perform a task that dictated his own curiosity.
- The **subject learned for himself, progressively** and **without mediation** as far as possible of directions to undertake the activity.
- In this way, learning became much more **meaningful**.
- Bruner wanted to direct education professionals, especially teachers:
- **the role of the teacher** should be no other than to **encourage students to be interested** in the subject, to make it interesting and useful for his life.

EROME SEYMOUR BRUNER
LEARNING AS DISCOVERY"

- This trend is part of the new methodologies of alternative teaching is having proven benefits such as:
- – The **promotion of creative problem solving**.
- – **Learning by successive approximations** as opposed to impulsive learning
- – The **empowerment of metacognitions** or, in other words, learning to learn.
- **8- Rote Learning -**
- Memory learning is one that we perform based on **storing information by repetitions** usually or known as mnemonic rules.
- Almost all of us can think of examples such as the subject of the **periodic table** or **multiplication tables**, which we practically learned at school without understanding the underlying logic.

- Although many are those who reject rote learning, **sometimes it is necessary**
- **Memory learning** goes through the different **phases of the process of storing information** and to understand it, rather than...
- a **constructivist approach** as in theories of pedagogical cut, we have to **contemplate them from a cognitive view**.
- The **information**, until it reaches the memory store, **goes through several phases** according to the model of **Atkinson and Shiffrin (1968)**, which are the following:
- – First we **perceive the stimulus** to be stored. If we do not pay **attention**, there will be no learning.

MEANINGFUL LEARNING	ROTE LEARNING
Concept is fully understood by students.	Verbatim memorization of new information.
Student can relate new information to what is already known.	No connection between previous and new knowledge.

- – That **information passes** to the store in the short term.
- – If it is **useful or valuable**, we will retain it.
- – If we retain it, it will be transferred to the warehouse in the long term and will be available to be retrieved according to the relevance it has and the daily use that we give to this information.

THANK YOU!

NPTEL

• Major Learning Theories in Psychology

- During the first half of the twentieth century, the school of thought known as **behaviorism** rose to dominate psychology and sought to explain the learning process.
- The three major types of learning described by behavioral psychology are **classical conditioning**, **operant conditioning** and **observational learning**.

- **What is Behaviorism?**

- Behaviorism was the **school of thought in psychology** that sought **to measure only observable behaviors**.
- Founded by **John B. Watson** and outlined in his seminal 1913 paper *Psychology as the Behaviorist View It*,
- the behaviorist standpoint held that **psychology was an experimental and objective science** and that **internal mental processes should not be considered** because they could not be directly observed and measured.

- Behaviorism is primarily concerned with observable and measurable aspects of human behavior
- Behavior is directed by stimuli; changes in behavior that result from stimulus-response associations
- Only behaviors worthy of study are those that can be directly observed; does not explain abnormal behavior
- All behaviors can also be unlearned, and replaced by new behaviors

- J.B. Watson, B.F. Skinner, Ivan Pavlov are the pioneers of Behaviorism

Figure 1.1 Classical Conditioning (Ivan Pavlov: 1849-1936)

Figure 1.1. This illustration shows the steps of Classical Conditioning.

1. Food = salivation
2. Food + Stimulus = salivation (conditioned stimulus)
3. Bell alone produces salivation (conditioned response)

Classical Conditioning example

Before conditioning

**FOOD
(UCS)**

**SALIVATION
(UCR)**

BELL

NO RESPONSE

During conditioning

**BELL +
FOOD
(UCS)**

**SALIVATION
(UCR)**

Key terms

- Stimulus-physical event
- Unconditioned stimulus
- Unconditioned response
- Conditioned stimulus
- Conditioned response

conditioning

SIMPLE CONDITIONING PROCEDURES

Different procedures of classical conditioning

- **Delay conditioning:** A form of forward conditioning in which the onset of the unconditioned stimulus (UCS) begins while the conditioned stimulus (CS) is still present.
- **Trace conditioning:** A form of forward conditioning in which the onset of the conditioned stimulus (CS) precedes the onset of the unconditioned stimulus (UCS) and the presentation of the CS and UCS does not overlap.
- **Simultaneous conditioning:** A form of conditioning in which the conditioned stimulus (CS) and the unconditioned stimulus (UCS) begin and end at the same time.
- **Backward Conditioning:** A type of conditioning in which the presentation of the unconditioned stimulus (UCS) precedes the presentation of the conditioned stimulus (CS).

Principles of Classical Conditioning

- **Acquisition**
- **Extinction**
- **Reconditioning**
- **Spontaneous recovery**

Principles of Classical Conditioning

- **Stimulus generalization:** The tendency of stimuli similar to a conditioned stimulus to evoke conditioned response.
- **Stimulus discrimination:** The process by which organisms learn to respond to certain stimuli but not to others

Higher Order Conditioning

- First-order – learning is obtained by associating a neutral stimulus with an unconditioned stimulus.
- Second-order – learning by pairing a neutral stimulus with a stimulus that has previously been converted into a conditioned stimulus through first-order conditioning.
- Higher-order – learning acquired by pairing a neutral stimulus with another stimulus previously conditioned. Higher-order conditioning is intrinsically weaker than its first-order counterpart. But the strength can be increased by using a robust unconditioned stimulus.

Classical conditioning: Day-to-day life examples

- A parent can turn “doing homework” into a game. Playing games (US) are fun (UR). After repeatedly paired together, doing homework (CS) and having fun (CR) create a positive association in the child.
- If a teacher is warm and nurturing (US), students feel connected and attached (UR). Students then associate going to school (CS) with connected feelings (CR) and learn to like going to school.
- If students are friendly and helpful to one another (US), students find it fun (UR) to go to school. Students associate going to school (CS) with fun (CR) and look forward to attending every day.

Expanding on Watson's basic stimulus-response model, Skinner developed operant conditioning based on the premise that satisfying responses are conditioned

Figure 1.2 Operant Conditioning (B. F. Skinner: 1904-1990)

Figure 1.2. This illustration illustrates Operant Conditioning. The mouse pushes the lever and receives a food reward. Therefore, he will push the lever repeatedly in order to get the treat.

Learning: Operant Conditioning

- A process through which organisms learn to repeat behaviours that yield positive outcomes or permit them to avoid or escape from negative outcomes

Key terms

- **Reinforcement:** The application or removal of a stimulus to increase the strength of a specific behaviour
- **Positive Reinforcement:** Stimuli that strengthen responses that precede them.

Example: praise and rewards

- **Negative reinforcement:** Stimuli that strengthen responses that permit the organism to avoid or escape from their presence.

- *Example:*

The penalty rules act as negative reinforcers to strengthen desirable behaviour.

Positive Punishment: A procedure by which the application of a stimulus decreases the strength of a behaviour.

- *Example:*

Disciplining (e.g. berating) a child for misbehaving

- **Negative Punishment:** When you remove something in order to decrease a behavior, this is called negative punishment.

- *Example:*

Putting a child in a time-out until they can decrease their aggressive behavior

How Reinforcement Schedules Work

Continuous Reinforcement vs. Partial reinforcement

Continuous Reinforcement

Desired behavior is reinforced every time it occurs

Most effective when teaching a new behavior

"SHAKE!"

Creates a strong association between behavior and response

Partial Reinforcement

Most effective once a behavior has been established

New behavior is less likely to disappear

Various partial reinforcement schedules available to suit individual needs

Schedules of reinforcement

- Rules determining when and how reinforcement will be delivered
 - **Continuous Reinforcement Schedule:** a schedule of reinforcement in which every occurrence of a particular behaviour is reinforced.
 - **Fixed-interval schedule:** A schedule of reinforcement in which a specific interval of time must elapse before a response will yield reinforcement.
 - **Variable-interval Schedule:** A schedule of reinforcement in which a variable amount of time must elapse before a response will yield reinforcement.
 - **Fixed-ratio Schedule:** A schedule of reinforcement in which reinforcement is delivered after a fixed number of responses have been performed.
 - **Variable-ratio schedule:** A schedule of reinforcement in which reinforcement is delivered after a variable number of responses have been performed.

Skinner believed the habits that each of us develops result from our unique operant learning experiences

Figure 1.3 Reinforcement and Punishment Comparison

	REINFORCEMENT (Behavior Increases)	REINFORCEMENT (Behavior Increases)
POSITIVE (Something is added.)	Positive Reinforcement Something is added to increase desired behavior. Ex: Smile and compliment student on good performance.	Positive Punishment Something is added to decrease undesired behavior. Ex: Give student detention for failing to follow the class rules.
NEGATIVE (Something is removed.)	Negative Reinforcement Something is removed to increase desired behavior. Ex: Give a free homework pass for turning in all assignments.	Negative Punishment Something is removed to decrease undesired behavior. Ex: Make student miss their time in recess for not following the class rules.

Extinction decreases the probability of a response by contingent withdrawal of a previously reinforced stimulus

➤ **Modeling , Shaping, and Cueing:**

- **Modeling** also known as observational learning
- **Shaping** is the process of gradually changing the quality of a response
- **Cueing** is providing a child with a verbal / non-verbal cue for the appropriateness of behaviour
- **Behaviour Modification:** has six basic components
 1. **Specification of the desired outcome:** increased student participation in class discussions
 2. **Development of a positive, nurturing environment**

3. Identification and use of appropriate reinforcers (**intrinsic and extrinsic rewards**)
4. **Reinforcement of behaviour patterns** develop until the student has established a pattern of success
5. **Reduction in the frequency** of rewards-a gradual decrease the amount of one-on-one review
6. **Evaluation and assessment** of the effectiveness of the approach: based on teacher expectations and student results

❑ **Criticisms:**

1. Oversimplifies the complexity of human behaviour
2. Ignores the internal psychological and mental processes
3. The principles of conditioning are not universal

❖ Educational Implications:

1. Students work for things that bring them **positive feelings**, and for approval from people they admire
2. **Behaviours can be learned, unlearned or relearned**
3. Ignoring an undesirable behaviour will go far toward eliminating it
4. **Organizing the time and duration of learning:**

studying intermittently or intensely;

Exmpl.- Students who learn in an overall manner by means of studying intensely just before an exam

are more successful at the exams;

- 5.The structure of the subject to be learnt: **learning, as a whole is superior to learning by parts**; learning by parts is more efficient in case of a lengthy topic

6. **Participation**: attention, motivation and readiness

7. **Feedback**: Knowledge of the results for improvements.

❑ **Classical Conditioning** -is when an unconditioned stimulus and response is manipulated with a conditioned stimulus to create a conditioned response

❑ **Operant Conditioning**- is a controlled response with a reward/punishment system according to the behavior

- The **learner needs reinforcements** to keep interest
- **Stimuli are effective in controlling** behavior
- The **behaviors can be measured** to record learning success
- overall learning may fade away after a short time, can be forgotten if the exam is delayed;
- **Intermittent study is more efficient for** those who want to achieve a permanent learning

Operant Conditioning

Cognitive Perspective

- **Learned helplessness**

When people feel that they have no control over their situation, they may begin to behave in a helpless manner. This inaction can lead people to overlook opportunities for relief or change.

For example, a woman who feels shy in social situations may eventually begin to feel that there is nothing she can do to overcome her symptoms. This sense that her symptoms are out of her direct control may lead her to stop trying to engage herself in social situations, thus making her shyness even more pronounced.

Observational learning

(Bandura 1977)

Albert Bandura believed that direct reinforcement and punishment could not account for all learning that occurs. What about when children copy the behaviour of parents when no reinforcement is given?

Observational learning: Basic Principles

- Must direct attention to specific model
- Must be able to remember what the person had said or done
- Need to be able to convert these memory representations into appropriate actions.
- Motivation is important. Only if the person finds the information useful, put them into action.

Key factors in observational learning

Learning

The process by which experience or practice results in a relatively permanent change in behavior or potential behavior

We are
here

Classical Conditioning

The type of learning in which a response naturally elicited by one stimulus becomes to be elicited by a different formally neutral stimulus

Pavlov and Watson

UCS, UCR, CS, CR

Operant Conditioning

The type of learning in which behaviors are emitted to earn rewards or avoid punishments

B.F. Skinner

Reinforcement and
Punishment

Social Cognitive Learning Theory

The type of learning in which behaviors are learned by observing a model

Albert Bandura

Modeling and Vicarious
Learning

Summary

❑ Basic Concepts of Behaviorism

- ✓ Conditioning: Learning takes place through Condition--
- ✓ Organism/Human being
- ✓ Stimulus-Response: Reaction/Relationship
- ✓ Reinforcement and punishment
- ✓ Extinction
- ✓ Generalization

The background of the slide features a faint, stylized illustration of several people in a meeting or collaborative work environment. Some are sitting at a table, while others are standing and gesturing. The illustration is in a soft, pastel color palette. In the top right corner, there are two circular logos: one is the official logo of Anna University, Chennai, and the other is a decorative emblem with a star-like pattern. The word 'STEELE' is written diagonally across the center of the slide in a large, light gray font.

Summary

- ✓ Discrimination
- ✓ Reinforcement ratio
- ✓ Spontaneous return
- ✓ High-level conditioning
- ✓ Observable & measurable behavior
- ✓ Please visit:
