

Lecture: 46

EFFECTIVE LEARNING: ASSESSMENT & FEEDBACK

PROF. ATASI MOHANTY
INDIAN INSTITUTE OF TECHNOLOGY
KHARAGPUR

• The New Normal of Education: A Psychological Perspective

- During Covid-19 the world was busy in preparing 1.5 billion learners for the new normal, i.e., remote learning.
- In India, we have around 350 million children, and with only 43.99% having access to the smart devices, we should feel privileged studying in a school where the teachers and the curriculum were in complete sync with the changing paradigm of the teaching-learning process.
- This unpredicted disruption has given **food for thought** to all the stakeholders & policymakers **to revive, reimagine** and **reshape the schooling perspectives** and **practices**.
- **Few of the value-additions & advantages are:**
- **Parents' Readiness:** The learning process had never been so **challenging** for any of the stakeholders.
- With the limit of one or two devices at home, parents have had to train their children in using the **online time, research time** and **assignment completion time**.
- While the **financial aspects of education** were one primary concern, the parents had been sensitized about the current situation with frequent communication and one-to-one sessions.

- The **psychological perspective** of students being **in a non-learning environment** for long must have been conveyed to them.
- An easily accessible channel of communication to address the frequent **concerns of parents in handling their children** might have been established.
- We did not overlook the social, emotional aspect of children.
- The best way was to listen to their concerns patiently and resolve.
- The **Readiness Model for New Normal** in Education had been designed by many educational institutions.
- **Teachers' Readiness**: The schools have had to ensure that all **teachers** and other support **staff were trained well** to handle any hurdles that might hinder the learning process, be it remote or in-campus in future.
- The millions of **webinars from the NGOs, foundations, industry experts** or the policymakers **could not easily guarantee the mindset change** or adaptability to new normal.

- Teachers were using **technology to perpetuate existing syllabus-centred pedagogy** rather than using technology to shift themselves to **learner-centred pedagogy**.
- The most crucial point to be kept in mind was their hands-on training on **Social Emotional Learning domain** as these unprecedented circumstances had given us the learners who were more aware, tech-savvy and might **not be very sure of the benefits of remote learning**.
- **Learners' Readiness**: The most **critical factor** that plays a significant role in the success of any remote learning program is the **readiness of the participants**.
- **Training students on being self-directed** and responsible for their learning outcomes is what will make them future-ready.
- regular training sessions on essential components like **net etiquettes, time management** and developing excellent **study skills** would take them towards the better future.

- Conversation in a pedagogical language that would make them back to the school and **adapt quickly to the new normal of teaching-learning system**.
- According to a study, more than **60 per cent of students said they would prefer to continue online education** even after schools reopen post lockdown.
- Only **38.7 per cent of students said they would be comfortable to join schools** post lockdown.
- The study conducted by Brainly, a knowledge-sharing community, stated that around **53.3 per cent of students prefer blended learning with a mix** of both online and offline learning after schools reopen.
- 42.5 per cent said they will continue to learn online only and 28.7 per cent said they are unsure and are still considering online learning as an option.
- A majority of students, about 55.2 percent, said they have been enjoying virtual classes during the lockdown.
- **More than one-third of the participants look forward to online education**, as per the survey.

- Many students also expressed their concerns about online mode of education due to **Internet connectivity issues in remote areas**.
- **What Skills Does the Year 2020 Teacher require and Beyond Need?**
- Since long time, the needs within the classroom have become increasingly shaped by technology ;
- the typical picture of a **teacher being** a dispenser of knowledge to the students has been replaced by that of **a facilitator**, only available **to guide the learning process**.
- The nature of **technical** and **soft skills** that a teacher needs to be effective in the class room has been **constantly evolving**.
- In 2018, Global Education and Skills Forum noted that the '**future**' **teacher would need the following 5 skills to thrive in the 21st century**:
 - **Strong subject knowledge**
 - **Being a facilitator**
 - **Strong social skills**
 - **External focus**
 - **Data analysis**

- The emerging trends in education, is that, According to **NEP-2020...continuous and systematic training of teachers at all levels** is paramount.
- Teachers must become versed in **deploying technology in teaching**, even at the most basic level.
- In same line, they need to be equipped with **life skills** that will inspire them **to build resilience** and provide **solutions to the educational needs** that arise around them.
- **What does today's teacher need to be successful in the classroom?**
- **Teaching Skills for the Year 2020 and Beyond-**
- **Digital Skills**-Technology has made it easy to connect with people spread across the globe;
- Beyond bridging the gap of distance, digital skills also make available to the teacher a plethora of **resources** that he / she can.

- harness for improving the quality of course/teaching materials and access to a network that equips teachers with tools of the trade
- Tools like Google Drive go a long way in consolidating the teaching process, by providing an encompassing platform for creating and organizing teaching notes, lesson plans and assessment sheets which can all be shared with other teachers.
- Technology is also available to aid communication between educators and parents/guardians.
- Life skills- Investment in life skills education is imperative;
- Teacher trainings that balance life skill education and technical skills training should be encouraged; life skills needed by teachers in today's world include:
 - Creativity and resourcefulness
 - A myriad of teaching styles must be developed in the spirit of inclusive education.
 - Participatory education demands creativity so as to build a needs-based approach to teaching.

- **Adaptability and innovation**-it is important to develop resilience that allows one roll with the punches.
- Through critical thinking and problem-solving modules, adaptability and innovation are skills that teachers can readily develop.
- This way, they are equipped to thrive in various scenarios.
- **Communication** -In a world where technology is the driving force of communication;
- it is important that teachers learn how to use those tools to communicate effectively, ensuring that their lessons, enthusiasm and intentions are not lost through the emotionally detached tools used today.
- Above all, teachers to cultivate an ever-learning mindset that will position them to seize opportunities and deliver their best to learners everywhere.
- Knowing the most effective strategies for how to learn can help us maximize our efforts when we are trying to acquire new ideas, concepts, and skills.

• Psychological Principles to Enhance Student Learning-

- Psychological Principles to know **how students think(Cognitive)**
- **Principle 1:** “The **beliefs or perceptions** students have about their intelligence and ability **affect their learning** and cognitive functioning.”
- Students who consider intelligence as a malleable entity tend to focus on their goals despite obstacles.
- In addition, these **students tend to get better results** compared to those who see intelligence as something they cannot modify.
- **Principle 2:** “**What students already know affects their learning.**”
- Thanks to the **social interaction** with their environment, students have different knowledge from which they cannot detach when facing their learning process.
- In this way, they tend to **assimilate new knowledge according to their previous experiences** and, therefore, conditioning them.

- **Principle 3:** “Students’ cognitive development and learning is not limited by the general stages of development.”
- Recent research indicated the need to “dose” in some way the knowledge transmitted to students according to the different stages of their cognitive development.
- **Principle 4:** “Learning is context-based, so the generalization of learning to new contexts is not done spontaneously, but must be facilitated.”
- For learning to be more robust, it is essential to extend it to new contexts instead of limiting itself to those already known.
- **Principle 5:** “The acquisition of knowledge and skills in the long term depends largely on practice.”
- The knowledge that is fixed are those that pass into the long-term memory, therefore, to fix a new skill or knowledge we must practice it or repeat it for a certain time;
- In addition, it is the knowledge that is fixed that has a greater possibility of evolving and becoming more complex.

THANK YOU

Lecture: 47

EFFECTIVE LEARNING: ASSESSMENT & FEEDBACK

PROF. ATASI MOHANTY
INDIAN INSTITUTE OF TECHNOLOGY
KHARAGPUR

- **Principle 6:** “Clear, explanatory and timely feedback to students is important for learning.”
- Generic and non-specific returns do not favor the correct learning of students, on the contrary, they harm;
- **Principle 7:** “Student self-regulation aids learning, and self-regulation skills can be taught.”
- Techniques linked to self-control, correct planning and division of tasks, as well as different mnemonic techniques contribute to more effective learning if taught and applied correctly.
- **Principle 8:** “Student creativity can be encouraged.”
- Creativity is a fundamental skill not only in the educational field but also for solving problems of daily life, therefore, educators must convey its importance and encourage it.

- **What motivates students?**(Motivational Aspect)
- **Principle 9:** “Students tend to enjoy learning and have better outcomes when their motivation is more intrinsic than extrinsic.”
- The motivation and involvement with the activities facilitate learning and generate the feeling of confidence in the student.
- **Principle 10:** “Students persist in the face of challenging tasks and process information more deeply when they adopt mastery goals rather than performance goals.”
- Mastery goals are those that are geared towards the acquisition or improvement of skills.
- **Principle 11:** “Teachers’ expectations of their students affect their students’ opportunities to learn, their motivation, and their learning outcomes.”
- This happens because sometimes students tend to accept the few expectations that teachers have about them and adapt to them.
- **Principle 12:** “Short-term (proximal), specific and challenging objectives are more motivating than long-term (distal), general and challenging objectives.”

- As we set goals, we are somewhat stimulating our performance, so if the objectives are close our performance will increase in the same way as our efficiency.
- 3. Social and Emotional Area: Why are social context, interpersonal relationships and emotional well-being important for student learning?
- **Principle 13:** “Learning is situated within multiple social contexts.”
- teachers must be able to assess the different knowledge generated in these contexts.
- **Principle 14:** “Interpersonal relationships and communication are fundamental both for the teaching-learning process and for the social and emotional development of students.”
- In turn, the quality of interpersonal relationships will determine the type of bond with peers and the teacher.
- The latter have a better link demonstrate greater effectiveness in understanding what has been learned.
- **Principle 15:** “Emotional well-being influences educational performance, learning and development.”

Dispositions to Learn

- independence
- creativity
- Self - motivation
- resilience

- Teachers must be able to understand and manage it to ensure a better learning experience.
- 4. **Learning Context Area**: Psychological Principles for Managing the Classroom Optimally
- **Principle 16**: “Students can learn what the expectations of social interaction and classroom behavior are through effective training and demonstrated behavioral principles.”
- The teacher must be responsible for transmitting them at the beginning of the course and reinforcing them throughout it.
- **Principle 17**: “Effective classroom management is based on (a) set and convey high expectations, (b) consistently foster positive relationships and (c) provide a high level of support to students.”
- All these factors contribute to generating an adequate climate in the classroom and thus favor the learning experience.

- **Assessment Area: How to assess student progress?**
- **Principle 18:** “Both formative and summative assessment are important and useful, but they must be applied and interpreted differently.”
- The former are used to guide work in the classroom directly. The second for judgments related to the student’s progress.
- **Principle 19:** “The best way to assess students’ skills, knowledge and abilities is through procedures based on psychology and well-defined standards of quality and impartiality.”
- **Principle 20:** “In order to properly assess evaluation data, it is necessary to interpret them in a clear, appropriate and impartial manner.”
- In line with the above principle, impartiality will ensure trust and respect on the part of students, which as mentioned in previous principles are essential for more effective learning.
- Teaching and learning are two sides of the same coin.

THANK YOU

Lecture : 48

EFFECTIVE LEARNING: ASSESSMENT & FEEDBACK

Prof. Atasi Mohanty
Indian institute of Technology
Kharagpur

- In the educational setting, **psychological principles** are knowledge, ideas, techniques that form the positive growth and development of the individual student, mentally, socially, emotionally, and morally.
- Education is a continuous **learning process, affected by conditions and experiences.**
- It influences the activities and interests of the learner.
- Some work better in a group than others; some are cooperative.
- Others are difficult; some do better in one subject than in others.
- Situations like these are due to **individual differences** among the students.
- Thus, the responsibility of a teacher is to use the **principles of educational psychology to boost the teaching/ learning process.**

Ceslyne B. Berdida

- 5 Important Psychological principles to enhance learning effectiveness-
- **Individual Differences**
- **Motivation**
- **Human Development**
- **Reward**
- **Punishment**
- Individual differences are the **unique ways each human being differs** from another.
- It **can be handled through using different techniques**, such as observation, interviews, rating scales, achievement tests, class discussions, questionnaires, socio-grams etc.
- In educational environment **motivation is the force** that maintains and alters the **quality of intensity** and **direction of behavior**.

- It refers to the forces that maintain and alter the quality of intensity and direction of behavior.
- It helps to get work done easier.
- When you **encourage your learners**, they become more **attentive to the learning situations**.
- **Motivation is the principle** that can **help the learner to learn** and remember, such as -
- **Arouse interest** in the child, show them that you are interested in them.
- **Listen to their individual needs** and concerns and explain the possibility of meeting such needs and concerns.
- **Encourage intrinsic motivation, self-direction**, and the enjoyment of doing something good for its own sake.
- Ensure you grant them a **break and rest to refresh their mind**.
- Give them home **assignments based on the topics** you have taught them.
- **Give external rewards** to the merited ones.

- Environment refers to different types of surrounding in which a developing child find himself.
- Environmental factors affect human development ,thus learning ability as well.
- A reward may be social, such as **clapping, or tangible, such as giving an exercise book, money, etc.** that can strengthen the desirable behaviors among learners/students.
- **Punishment** is one of the principles that **control undesirable behavior.**
- It reinforces to depress a negative behavior such as truancy and unprovoked aggression.
- **How students learn better ?**
- **Cognition and learning: How do students think and learn?**
- A great deal of research has discovered **how thinking and learning can be improved in the classroom.**

• 1. Growth mindset

- Students' beliefs or perceptions about intelligence and ability affect their cognitive functioning and learning.
- Learners who hold the growth mindset that intelligence is malleable, and success is related to effort level are more likely to remain focused on goals and persist despite setbacks.
- A discussion of growth versus fixed mindsets because it helps students understand how their beliefs about intelligence can influence their own academic success;

• 2. Prior knowledge

- What students already know affects their learning.
- Prior knowledge influences both conceptual growth and conceptual change in students.
- With conceptual growth, students add to their existing knowledge, and with conceptual change, students correct misconceptions or errors in existing knowledge.
- Facilitating conceptual growth or change requires first obtaining a baseline level of student knowledge prior to the start of each unit through formative assessment.

• 3. Limits of stage theories

- Students' cognitive development and learning are not limited by general stages of development.
- It is important for instructors teaching Piaget's cognitive stage theory to also reference the limitations of this approach.
- Psychology curricula should highlight the significance of Lev Vygotsky's theory of zone of proximal development and the critical role that interactions with those who are more capable can have on learning and growth.
- Instructors can use this research to facilitate learning by designing instruction that utilizes scaffolding, differentiation and mixed ability grouping.

• 4. Facilitating context

- Learning is based on context, so generalizing learning to new contexts is not spontaneous, but rather needs to be facilitated.

Limits of stage theories

Students' cognitive development and learning are not limited by general stages of development

- Student growth and **deeper learning** are developed when instructors help students **transfer learning** from one context to another.
- Students will also be better able to **generalize learning to new contexts** if instructors invest time in focusing on deeper learning.
- One method of developing this skill is to have students use their understanding of a particular unit to **generate potential solutions for real-world problems**.
- **5. Practice**
 - Acquiring **long-term knowledge** and **skill** is largely dependent on **practice**.
 - Empirically tested **strategies** will help students more **effectively encode learned materials into long-term memory**.
 - By issuing **formative assessment** frequently through practice problems, activities and sample tests, instructors can **help students increase their knowledge, skills and confidence**.
 - Conducting practice activities at spaced intervals (**distributed practice**) will help students achieve greater **increases in long-term retrieval ability**.
 - Practice tests should include **open-ended questions** that require both the **retrieval of existing knowledge** and the challenge of **applying that information to new situations** or contexts,

- **6. Feedback**

- Clear, explanatory and timely feedback to students is important for learning.
- This principle highlights the importance of instructor responses and indicates the best manner in which to deliver feedback to students in order to maintain or increase motivation to learn.

- **7. Self-regulation**

- Students' self-regulation assists in learning and self-regulatory skills can be taught.
- Self-regulation skills, including attention, organization, self-control, planning and memory strategies, improve learning and engagement and can be taught through direct instruction, modeling and classroom organization.
- Teachers can model highlighting difficult concepts , breaking large projects into manageable components, using well designed rubrics and allowing sufficient processing time through questioning, summarizing and practice.

Prior Knowledge

What students already know affects their learning. A learner's understanding of a text can be improved by activating their prior knowledge.

• 8. Creativity

- Student creativity can be fostered.
- Creativity is considered a critical skill, it can be taught, nurtured and increased.
- This principle describes **specific methods of structuring assignments to increase creativity** and ideas for **how to model creative problem solving**.
- Creativity in the psychology classroom can include opportunities for **student-designed research projects, video projects, demonstrations and model building**.

• Motivation: What motivates students?

- Students who are motivated and interested in learning are more successful.

• 9. Intrinsic motivation

- Students tend to enjoy learning and to do better when they are more intrinsically rather than extrinsically motivated to achieve.

- Instructors can increase intrinsic motivation through **classroom practices** and **activities** that support the fundamental need of students to feel autonomous.
- There is a place for **extrinsic motivation** in education.
- During the classroom discussions **students can examine their personal motivations** and how they influence their success.
- **10. Mastery goals**
- **Students persist** in the face of challenging tasks and **process information more deeply** when they **adopt mastery goals** rather than performance goals.
- Students who form mastery goals are **focused on attaining new skills or increasing existing ability**, but students who develop performance goals typically are focused simply on showing adequate ability.
- When students set performance goals, they have a tendency to avoid tasks that might expose weaknesses and end up missing opportunities that would foster the development of new skills.
- Those **with mastery goals are more likely to be motivated to learn new skills and achieve higher levels of competence.**

• 11. Teacher expectations

- Teachers' expectations about their students affect students' opportunities to learn, their motivation and their learning outcomes.
- Psychological research has uncovered ways for teachers to communicate high expectations for all students and avoid creating negative self-fulfilling prophecies.
- When discussing self-fulfilling prophecies and the Rosenthal and Jacobson study during the social psychology unit, Principle 11 can be used by teachers to show students how they can prevent negative self-fulfilling prophecies.

• 12. Goal setting

- Setting goals that are short term (proximal), specific and moderately challenging enhances motivation more than establishing goals that are long term (distal), general and overly challenging.

- Use of short-term (proximal), specific and moderately challenging goals increase **self-efficacy ,competency towards larger goals**.
- Students should maintain a **record of progress** toward their goals which is monitored by both the student and the instructor.
- Students to become **intermediate risk takers**, which is one of the most significant attributes present in achievement-oriented individuals.
- **Social and emotional dimensions:**
- **Why are social context, interpersonal relationships and emotional well-being important to student learning?**
- These principles reflect the **importance of relationships, culture, community and well-being on learning**.
- Instructors can help students by **fostering healthy relationships** with them and an interest in their lives outside the classroom.

THANK YOU

Lecture : 49

EFFECTIVE LEARNING: ASSESSMENT & FEEDBACK

Prof. Atasi Mohanty
Indian institute of Technology
Kharagpur

• 13. Social contexts

- Learning is situated within multiple social contexts.
- This emphasizes how the various communities students belong to (e.g. families, peer groups, schools, neighborhoods) and their culture (e.g. shared language, beliefs, values and behavioral norms) influence learning.
- This principle is related specifically to many concepts from social psychology (e.g., norms, attribution theory, individualistic versus collectivist cultures) and provides suggestions for incorporating culture into every unit to increase student engagement and build stronger relationships.

• 14. Interpersonal relationships

- Interpersonal relationships and communication are critical to both the teaching-learning process and the social development of students.
- This provides detailed and specific guidelines for improving both teacher-student and student-peer relationships in the classroom.

• 15. Well-being

- Emotional well-being influences educational performance, learning, and development.
- Various components of emotional well-being can be included such as self-concept and self-esteem, self-efficacy and locus of control (motivation and personality) and happiness and coping skills (emotion and stress).
- Context and learning: How can the classroom best be managed?
- The classroom management emphasize on how to develop a classroom climate that enhances learning.

• 16. Classroom conduct

- Expectations for classroom conduct and social interaction are learned and can be taught using proven principles of behavior and effective classroom instruction.

- Numerous research-based ideas are presented for both correcting inappropriate student behaviors and for establishing appropriate replacement behaviors at both the classroom and school-wide levels.
- **17. Expectations and support**
- Effective classroom management is based on (a) setting and communicating high expectations, (b) consistently nurturing positive relationships, and (c) providing a high level of student support.
- This principle highlights practical techniques to create a culture of high academic achievement and positive classroom behavior at both the classroom and school levels.

• Evaluation

- Evaluation is the process of judging the value or worth of an individuals achievements or characteristics

• Why do we evaluate?

- As a faculty, you may be having some ideas about assessments
- To test – their knowledge, give grades, check their performance
- What student have learned?
- How they have learned?

- Evaluation is the process of determining to what extent the educational objectives are being realized

Ralph Tyler

Summative Assessment

The goal of summative assessment is to evaluate student learning at the end of an instructional unit by comparing it against some standard or benchmark. Summative assessments are often high stakes, which means that they have a high point value.

Information from summative assessments can be used formatively when students or faculty use it to guide their efforts and activities in subsequent courses.

PURPOSE OF EVALUATION

- To discover the extend of competence
- To predict the educational practices
- To certify student's degree, proficiency in a particular educational practice
- To appraise the status of and changes in student's behavior
- To make provision for guiding the growth of the individual student
- To diagnose the individual students educational weakness and strength

• Purpose of Evaluation-

- Test the efficiency of teachers
- Appraise the teachers and supervisors competence
- Improve instructions, measurements and measuring devices
- Bring out the inherent capabilities of a student, such as attitudes, habits, appreciation and understanding, manipulative skills in addition to conventional acquisition of knowledge
- Serves as method of self improvement, improving school learning relations and as a guiding principles for the selection of supervisory techniques

SCOPE OF EVALUATION

- Value judgment
- Ascertaining the extent to which the educational objectives have been attained
- Effectiveness of appraisal or methods of instruction
- Identifies pupil's strengths and weakness, difficulties and problems, needs and demands
- Provide baseline for guidance and counseling

Scope of Evaluation

- Placements and promotions in jobs
- Development of attitudes, interests, capabilities, creativity, originality, knowledge and skills etc.
- Development of tools and techniques
- Development of curriculum and for its revision
- Interpretation of results
- Helpful for curriculum planners and administrators to improve the curriculum pattern

- **Assessment:** How is student progress assessed?
- **Type of Assessment:**
 - Formative and Summative Evaluation as Types of Assessment
 - Formative Assessment
 - Summative Assessment
 - Characteristics of Formative and Summative Assessment

**Assessment OF Learning (Summative)
vs.
Assessment FOR Learning (Formative)**

• FORMATIVE AND SUMMATIVE EVALUATION

- Formative and summative assessment are interconnected.
- The vast majority of genuine formative assessment is informal, with interactive and timely feedback and response.
- Formative assessment has the greatest impact on learning and achievement.
- Formative and summative assessments are both important and useful, but they require different approaches and interpretations.
- **Assessment for learning, (AfL), is a teaching approach that generates feedback students can use to improve their performance.**
- From a teacher's perspective, this could be as simple as observing class discussions, asking questions and **reviewing students' work in progress.**

• Formative Assessment-

- Assessment for learning
- Taken at **varying intervals** throughout a course to provide **information** and **feedback** that will help improve:
- the quality of student learning
- the quality of the course itself
- Assessment is often referred to in relation to summative assessment,
- **Feedback**, with an emphasis on assessment for learning, can **positively affect teaching and learning**.
- The **feedback includes** information on:
 - **How students are learning**
 - **Their progress**
 - **The nature of their understanding**
 - **Any difficulties they are having**

Formative Feedback

- Identifies where the student is now
- Identifies where the student needs to go
- Compares the two levels and provides information about the gap
- Provides a mechanism to close the gap

FEEDBACK

FORMATIVE ASSESSMENT

Is carried by	Inform	Role of a learner
A teacher during the term	learners about the extent of accuracy of their tasks performance during the study of material; teachers on the progress of learners to manage the teaching process.	- actively participates in the educational process; - understands assessment criteria and descriptors; - self-assess/assess each other.
Role of a teacher		Forms of carrying out assessment
- clearly prescribes the assessment criteria according to the learning objectives; - develops tasks according to the assessment criteria; - develops descriptors to the task; - provides effective feedback to learners; - makes adjustments in learning and assessment;		• individual • in pairs • in groups • In transferable groups

- Type of formative evaluation

- ANECDOTAL RECORDS
- QUIZZES
- ESSAYS
- DIAGNOSTIC TESTS
- LAB REPORTS

- ***Formative assessments on different points of view***

- Formative assessment refers to the frequent, interactive assessment of student progress to identify learning needs and shape teaching (OECD,2005)
- It is a planned process in which the teacher or students use assessment-based evidence to adjust ongoing learning and instruction. (Popham,2011)
- All those activities undertaken by teachers, and by their students in assessing themselves, which provide information to be used as feedback to modify the teaching and learning activities in which they are engaged” (Black & William,1998).

• Plan of the formative evaluation-

Assess progress towards meeting the curriculum's aims and objectives

Assess how effectively projects are contributing to meeting the curriculum

Gather and publish best practice

Identify gaps and issues

Raise awareness of the plan and stimulate discussion

Ensure that course outputs are meeting students needs

Ensure the curriculum can respond flexibly to changes

Formative assessments are typically used as a part of everyday practice and are given either prior to or during instruction.

Such tools are designed to collect evidence regarding the progress of student learning in order to provide effective guidance.

Aspects of formative assessment

	Where the learner is going	Where the learner is	How to get there
Teacher	Clarify and share learning intentions	Engineering effective discussions, tasks and activities that elicit evidence of learning	Providing feedback that moves learners forward
Peer	Understand and share learning intentions	Activating students as learning resources for one another	
Learner	Understand learning intentions	Activating students as owners of their own learning	

- Frequent use of formative assessment accompanied by immediate and specific instruction helps students achieve learning goals and assume a greater responsibility of their own learning process.
- The analysis of data collected through formative assessment allows the instructor to differentiate instruction and provide appropriate individualized support.

Formative Assessment

Guided practice for students.

Adjust instruction on the fly.

Provides a snapshot of teaching/learning while they are still happening.

Check for understanding.

Guides future instruction.

@jeniferlagarde

Formative assessment

These are the important elements of effective formative assessment:

• *Summative Assessment -*

- Assessment of learning
- Generally taken by students **at the end of a unit or semester to demonstrate the "sum"** of what they have or have not learned
- The most traditional way of evaluating student work.
- Concentrates on **learner outcomes** rather than only the program of instruction.
- Summary of evidences indicate extent of learning achievements which can classify or **for certification or giving of honors/awards.**
- Summative assessments, result in an **overall evaluation of student learning or program effectiveness** and are typically utilized at the **end of a unit or course** thus having more limited impact on current instruction.

• Type of summative evaluation

- UNIT TESTS
- FINAL EXAMS
- STATEWIDE TESTS
- NATIONAL TESTS
- ENTRANCE EXAMS

REPORT CARD				
GRADING PERIOD	1	2	3	4

Student: _____ Grade: _____ Year: _____				

The process of Summative Assessment

Planning	Organization	Implementation
• Subject programme • Course plan • Assessment plan for an academic year, indicating the periods, methods, control tasks for all types of summative assessment, developed by a methodical union and approved by the School's Teachers Council.	• Handbook for Teachers on Criteria-based Assessment • Methodical recommendations for Summative Assessment	• The criterial assessment rules
The number of assessment procedures is clarified based on the subject programme: 1. Natural-mathematical and language subjects - units; 2. Social subjects - cross-curricular topics	Tasks are developed in accordance with the assessment criteria. Descriptors and points are designed for the summative assessment across a unit / cross-curricular topics, terms	✓ Summative assessment across a unit / cross-curricular topic (teacher) ✓ Summative assessment for a term (teacher) ✓ Summative assessment for levels of education (NTC) are carried out.

• Summative Assessment-

- Should reflect formative assessments that precede it.
- Should match material taught
- Should align with instructional/curricular outcomes
- May determine student's exit achievement
- May be tied to a final decision, grade or report

ALGORITHM OF SUMMATIVE ASSESSMENT DEVELOPMENT ACROSS A UNIT/ CROSS- CURRICULAR TOPIC

*follows the Methodical Recommendations of the Center of Pedagogical Measurements (CPM) and National Academy of Education (NAE) (or uses them)

FORMATIVE

Assessment

SUMMATIVE

Characteristics	Formative	Summative
PURPOSE	To provide ongoing feedback and adjustment to instruction	To document student learning at the end of an instructional segment.
WHEN CONDUCTED	During instruction and after instruction	After instruction
STUDENT INVOLVEMENT	Encouraged	Discouraged
STUDENT MOTIVATION	Intrinsic, mastery-oriented	Extrinsic, performance-oriented

Characteristics	Formative	Summative
TEACHER ROLE	To provide immediate, specific feedback and instructional correctives.	To measure student achievement and give grades.
LEARNING EMPHASIZED	Deep understanding, application, and reasoning	Knowledge and comprehension
LEVEL OF SPECIFICITY	Highly specific and individual	General and group oriented
STRUCTURE	Flexible, adaptable	Rigid, highly structured

• Formative assessment and feedback

- Strategies can serve many purposes for both teachers and students, including the following ones:
- – Elicit information about learning goals, intentions, and criteria for success.
- – Elicit information about students' understanding, state of learning, state of knowledge, etc.
- – Elicit information about the benefits and constraints of learning tactics and/or strategies.
- – Elicit information about the benefits and constraints of instructional material and strategies.
- – Provide information on the kinds of information and/or strategies that would be useful for moving forward in the learning process.
- – Provide the basis for adapting instructional material and strategies to students' levels of knowledge and understanding.

- Formative assessment includes all activities that instructors and/or learners undertake to get information about teaching and learning that are used in a **diagnostic** manner (Boston, 2002).
- This **diagnostic information** can be used to **improve** teaching as well as learning and affects the planning, the **process** , and the **outcomes of instructional situations**.
- Information retrieved from formative assessment provides the basis for feedback to everyone involved in the learning process (teachers, students, parents, etc.),
- Formative assessment is used to (re-)“form” the instructional and/or learning process, while “**summative**” assessments “sum” up outcomes.
- Summative assessment instruments (e.g., tests) and **outcomes can also be used as information for formative assessment processes.**

Examples of formative assessment

- | | |
|--------------------------------------|-------------------------------------|
| <u>1. Observations</u> | <u>9. Kinesthetic Assessment</u> |
| <u>2. Questioning</u> | <u>10. Individual Whiteboards</u> |
| <u>3. Discussion</u> | <u>11. Laundry Day</u> |
| <u>4. Exit and Admit Slips</u> | <u>12. Four Walls & Corners</u> |
| <u>5. Learning and Response Logs</u> | <u>13. Constructive Quizzes</u> |
| <u>6. Graphic Organizers</u> | <u>14. Think Pair Share</u> |
| <u>7. Peer and Self Assessment</u> | <u>15. Appointment Clock</u> |
| <u>8. Visual Representation</u> | <u>16. Projects, Presentations</u> |

** Formative assessment tells us how we are learning.*

PROGRAMS

The World is
Your Classroom

- **What constitutes effective feedback ?**
- The impacts of effective feedback on teaching and learning in relation to **improving success and achievement, creating responsive learners and enhancing teachers' teaching,**
- Feedback is a **pedagogical framework** of assessment, for learning not of learning that **promotes students engagement and learning** (Black & William, 2009).
- **Effective feedback** has been described as: **specific, descriptive, student initiated** (combined with self/ peer assessment), **time appropriate, suited to needs of individuals**, provides strategies for **improvement**, allows **time** for action, happens as a **conversation** and **communication** surrounding the adequacy of the feedback provided .
- If **feedback is presented alongside a grade**, the **benefits** which the feedback provided can be **reduced**.
- If the **grade is omitted**, it **supports the learner** and parents to **focus on the learning** rather than interpretation of the grade (**Black et al., 2004**).

Giving Constructive Feedback

- Be descriptive
- Don't use labels
- Don't exaggerate
- Don't be judgmental
- Speak for yourself

THANK YOU

Lecture : 50

EFFECTIVE LEARNING: ASSESSMENT & FEEDBACK

Prof. Atasi Mohanty
Indian institute of Technology
Kharagpur

- For teachers it is important to reflect on practices in the classroom and how these affect students.
- Effective feedback is necessary for improvement and learning, influential in creating learners responsive to their learning and important in enhancing teachers' teaching
- The teacher and the learner both must act to have the best outcomes for learning (Black & William, 2004).

➤ The key processes that underpin teaching and learning:

➤ Establishing the learners' current state of learning, where they are going (their goal) and what needs to be done to get them there, are considered.

➤ When students are appropriately informed about their progress they are able to identify their next steps for learning .

➤ Educators should prioritize formative strategies of assessment over summative and use evidence gathered from formative assessment to serve as the assessment to summarise achievement (Knight ,2000) .

❑ Creating Responsive Learners

- Students must be encouraged to actively process the information and feedback received, known as 'mindfulness' leads to the greatest gains in performance (Lipnevich et al., 2013).
- Student-centred learning where students actively construct their own knowledge and skills has been a part of educational pedagogy (Nicol et al., 2009).
- feedback is important in creating responsive learners, students who are better at self-regulation produce better internal feedback and better able to achieve their goals.
- students' mind-set, either growth or fixed, can influence the effectiveness of the feedback regardless of how effective it was presented.

❑ Enhancing teachers' teaching

- Feedback can be used to modify teaching & learning activities to meet the needs of the students. By students' feedback the teacher can identify where to focus in teaching.

Culturally Responsive Teaching is Transformative

- It means respecting the cultures and experiences of various groups and then uses these as resources for teaching and learning.
- It appreciates the existing strengths and accomplishments of all students and develops them further in

- Teaching and learning is a **reciprocal relationship** where feedback is not only important for the learners and their learning but also for the way teaching can cause learning.
- Teachers to be **critically engaged with research** literature and must continue to be the **reflective practitioner** to improve student learning and cater to their diverse needs .
- If **teachers focus** on reinforcing the view that **feedback will help students to learn** rather than dictate how smart they are, it **enables students to learn more** (Black et al., 2004).

❑ Seven principles of good feedback practice

- 1. Facilitates the development of self-assessment(**reflection**) in learning.
- 2. Encourages teacher and peer **dialogue around learning**.
- 3. Helps clarify what **good performance is**(**goals**, criteria, standards expected).
- 4. Provides opportunities to **close the gap** between **current** and **desired performance**.
- 5. **Delivers high quality information** to students about their learning.

- 6. Encourages positive motivational beliefs and self-esteem.
- 7. Provides information to teachers that can be used to help shape the teaching.

□ Giving Assessment Feedback

➤ Objectives-

- Justify to students how their mark or grade was derived
- Identify and reward specific qualities in student work
- Guide students on what steps to take to improve
- Motivate them to act on their assessment
- Develop their capability to monitor, evaluate and regulate their own learning (Nicol, 2010).

□ To Benefit Students' Learning,

➤ feedback needs to be:

- *constructive*. - Highlighting the strengths and weaknesses of a given piece of work, it should set out ways in which the student can improve the work.

- *timely*. –Give **Feedback** while the assessed work is **still fresh in a student's mind**, before the student moves on to subsequent tasks.
- *meaningful*. It should **target individual needs, be linked to specific assessment criteria**, and be received by a student in time to benefit subsequent work.

❑ **Constructive, timely and meaningful feedback:**

- encourages students **to think critically about their work** and to reflect on what they need to do to improve it
- helps them see their **learning in new ways** and gain increased satisfaction from it
- helps **promote dialogue** between staff and students

❑ **Effective feedback:**

- guides students to adapt and adjust their learning strategies
- guides teachers to adapt and adjust teaching to accommodate students' learning needs
- guides students to become independent and self-reflective learners, and better critics of their own work

PRINCIPLES OF GIVING EFFECTIVE FEEDBACK

- Give feedback only when asked to do so or when your offer is accepted.
- Give feedback as soon as possible.
- Focus on the positive.
- Needs to be given privately wherever possible.
- Focus on behaviors that can be changed, not personality traits

- stimulates reflection, interaction and dialogue about learning improvement
- **constructive**, so that students feel **encouraged** and **motivated** to improve
- has consequences, so that it **engages students** by requiring them to attend to the feedback as part of the assessment
- efficient, so that staff can manage it effectively.
- formative assessment can also be **applied to all stages of planning, conducting, and evaluating instruction** (e.g., by means of peer feedback, student feedback, etc.) in order to improve instruction.
- Authors have also conceptualized the formative assessment process as a cyclical process, (Natriello's (1987);
- **Evaluation process can be designed from a teacher's perspective in eight phases like,**
 - (1) establishing the purpose of the evaluation,
 - (2) assigning tasks to students,

10 Principles for Effective Feedback

1 - Be specific

2 - Focus on observed behavior

3 - Keep it impersonal

4 - Link it to goals

5 - Prioritize

6 - Make it well-timed

7 - Ensure understanding

8 - Make sure it is controllable

9 - Make it constructive

10 - Tailor it to the employee

- (3) setting criteria for student performance,
- (4) setting standards on student performance,
- (5) sampling information on student performance,
- (6) appraising student performance,
- (7) providing feedback on student performance, and
- (8) monitoring outcomes of the evaluation of students.

Fig. 1 Formative assessment cycle according to Natriello (1987)

MODEL OF FEEDBACK TO ENHANCE LEARNING

Taken from Hattie, J. and Timperley, H. (2007). The Power of feedback. *Review of Educational Research*, 77-87.

GOOD FEEDBACK PRINCIPLES: A SUMMARY

- Promote dialogue and conversation around the goals of the assessment task.
- Emphasise the instructional aspects of feedback and not only the correctional dimensions.
- Remember to provide feed forward-indicate what students need to think about in order to bring their task performance closer to the goals.
- Specify the goals of the assessment task and use feedback to link student performance to the specified assessment goals.
- Engage the students in practical exercises and dialogue to help them to understand the task criteria.
- Engage the students in conversation around the purposes of feedback and feed forward.
- Design feedback comments that invite self-evaluation and future self-learning management.
- Enlarge the range of participants in the feedback conversation-incorporate self and peer feedback.

- feedback can be provided by various external sources of information (e.g., teachers, peers, parents, computer-based systems) and/or ;
- by internal sources of information (i.e., information perceivable by the learner while task processing).
- External feedback strategies can be designed and implemented in many ways.
- In order to be effective, feedback content has to be processed and taken up meaningfully by the student.
- Narciss has developed the interactive two-feedback loops model (ITFL model, referred to as the **interactive tutoring feedback model**, Narciss, 2017).
- ITFL model suggests that feedback is considered as a **multidimensional instructional activity** that aims at contributing to the **regulation of a learning process** in such a way that **learners acquire the knowledge and competencies** needed to **master learning tasks** as well as the **regulation of their learning**.

Fig. 2 Interactive two-feedback loops model. (Narciss, 2017; reprinted with permission from Springer Nature)

FIGURE 1: A Model of the Formative Assessment and Feedback

Fig. 3 Dialogic feedback cycle. (Adopted from Beaumont et al., 2011)

- 1. A guided preparation phase in which students are provided with **explanations**, **discussions**, and **exemplars in order to clarify task requirements, success criteria**, and standards.
- The results from this phase can serve as **feedforward** for the task completion phase.
- 2. A **guided in-task phase** in which they are offered practice opportunities that should be scaffolded by generic feedback, pre-assessment tips, and/or peer assessment support.
- 3. The **final feedback** phase in which students should be provided with formative written feedback that refers clearly to the criteria and standards and are prompted to reflect and discuss it.
- **Feedback is a central, integral, and continuous process of student assessment;**
- Assessment feedback guidance is explicit;
- Greater emphasis is placed on feedforward compared to feedback activities;
- Students are engaged in and with the process.

Guided Practice

Why so important?

Corrective Feedback

During GP, the teacher:

Assesses students' progress

Analyzes errors

Addresses needs one-on-one

"It is always more difficult to re-teach skills that have been practiced **incorrectly than to provide careful practice **the first time around.**"**

http://www.sagepub.com/upm-data/14255_Chapter4.pdf

- The technicalities of feedback are attended to in order to support learning;
- Training in assessment feedback/forward is an integral part of assessment design.

Table 1 Feedback design principles and exemplary approaches (adopted from Narciss, [2017](#))

Feedback design principle	Approaches and examples of good practice
Distinction of an internal and external feedback loop	
Feedback strategies should be interactive rather than just focusing on transmitting external feedback	Ask-tell-ask-act strategy (e.g., French, Colbert, Pien, Dannefer, & Taylor, 2015) GROW strategy (e.g., Whitmore, 2010) Interactive tutoring feedback strategy (Narciss, 2008 , 2013)
Controlled process – control levels and variables – standards and reference values for control variables	
Identify malleable and measurable variables that may serve as indicators of how well the process of task completion is currently running	Competence modeling (e.g., Fouad et al., 2009 , 2022) Common core standards Assessment rubrics for written assignments
Select or specify the criteria and standards of high-quality task processing and completion	Competency scales (e.g., counseling scale Lambie, Mullen, Swank, & Blount, 2018)

Reflect, share, and discuss the criteria and standards of high-quality task processing and completion within instructional context (e.g., teacher-to-student, peer-to-peer; student-to-teacher)

Provide exemplars of diverse quality to make students actively engage in reflecting, sharing and discussing high vs. low levels of quality criteria
Provide competency matrices with criteria for various levels, and make students reflect and discuss them

Assessment instruments and processes – internal and external

Select or develop means/devices (e.g., assessment rubrics for written assignments) for assessing the current state of competency

Tabular presentation of assessment rubrics with Likert-like response options
Competency matrices eliciting behavioral descriptors for various competence levels

Reflect, share, and discuss the assessment instruments

Provide worked examples of diverse quality to clarify if and how the assessment instrument can be applied to measure various levels of competency
Provide occasions for peer assessment and/or peer feedback

Provide occasions for generating internal feedback before offering external feedback.

Prompt self-assessment with regard to the relevant assessment standards and make self-assessment overt
Provide self-assessment work sheets (e.g., competency matrices, rubric tables) to help students to identify which of the criteria they have met as well as those they have not (yet) met

External assessment

Use assessment work sheets (e.g., competency matrices, rubric tables) to identify the current level of competency

Generate and provide external feedback

Generate competency-oriented, concrete, and actionable external feedback message(s)

Apply W3-strategy to identify gaps and select or specify control actions that may contribute to close the gaps

- What worked well?
- What did not work well?
- What can be done to ...?

(continued)

Feedback design principle	Approaches and examples of good practice
Provide information on the externally assessed level of performance in relation to the standards	Provide a tabular work sheet detailing standards/ criteria, as well as external feedback with regard to the criteria (same structure as the internal feedback work sheet)
Internal processing of feedback and generating of control action	
Scaffold students in using the external feedback mindfully for (a) detecting gaps that have to be filled in order to meet the required standards and (b) deriving control actions to close these gaps	Provide a tabular work sheet detailing standards/ criteria, internal as well as external feedback with regard to the criteria Provide guiding questions for comparing standards with external and internal feedback Prompt students to make a feedback action plan Provide access to tutoring information (e.g., hints; guiding questions, worked examples) that may be used to identify control actions

Reflect, share, and discuss potential control actions for closing gaps between the current level of performance and the standards

Ask students to share and discuss their feedback action plan
Ask for a revision letter detailing what corrective actions to take in order to close the gaps
Collaborative revision of writing assignments based on feedback
Collaborative formulation of concrete suggestions for corrective action

Control action – cyclical processes of acting – assessing – feedback – information processing – controlling

Offer the occasion for applying the selected corrective actions

Provide occasions for revision, another attempt of task completion, etc.

Prompt students to self-assess and generate internal feedback

Provide self-assessment work sheets (e.g., competency matrices, rubric tables) to help students to identify which of the criteria they have met, what has been improved, and what might still need improvement

Provide external feedback together with tutoring information (i.e., hints, guiding questions, explanations, analogies) to help students select and apply adequate corrective actions if they failed to do so without assistance

Elicit progress and emphasize successful attainments of high-quality standards
Emphasize

- What worked well
- What has been improved
- What can be done to further improve . . .

As in the first cycle, offer occasions for engaging in corrective actions which apply the tutoring feedback information

Provide occasions for revision, another attempt at task completion, etc.

Fig. 4 Heuristic research model eliciting design and research issues on formative feedback for an instructional context

• Summary of the Research Findings:

- 1. Empowering Students to Self-Assess and Generate Internal Feedback;
- 2. Empowering Students to Peer-Assess and Generate Peer Feedback;
- 3. Empowering Students to Be Feedback Literate;
- 4. Empowering Teachers to Be Feedback Literate;
- 5. Exploiting and Investigating the Potential of Modern Information Technologies.

Feedback in educational contexts is information provided to a learner to reduce the gap between current performance and a desired goal (Sadler, 1989).

Feedback is widely regarded by researchers as crucial for improving not only knowledge acquisition but learner motivation and satisfaction.

An important conclusion to take from these studies is that there is no single type of feedback appropriate for all learners in all instructional situations.

Three stages to effective feedback

1. **Feed-up:** Before feedback can be given, students need to know the learning intention(s). Feed-up clarifies for the student Where am I going? What are the goals? This information sets the context for feedback.
2. **Feedback:** Feedback itself focuses on monitoring and assessing learning progression in relation to the learning intention or task. It is about How am I doing? What progress is being made towards the goals?
3. **Feed-forward:** This relates to the next steps required for improvement on a specific task or learning intention. It is about Where to next? What activities need to be undertaken to make better progress? Here the answer is likely to be directed to the refinement of goals, and seeking more challenging goals, because these are most likely to lead to greater achievement.

Effective feedback is when teachers and students address all three of these questions.

Three levels of feedback

Feedback operates on, or can be geared towards, three levels. These are:

1: Task-level (or product) feedback

Feedback aimed at the task or product describes students' performance and may offer students directions on how to acquire more, different or correct information.

Example: *"That is correct. Could you include more information about the Treaty of Versailles?"*

Immediate feedback is likely to be most effective for task-level feedback.

2: Process-level feedback

Feedback aimed at the process of understanding focuses on how the student has completed a task or created a product.

Example: *"You might find it easier to punctuate this page if you read it aloud with a peer."*

Process-level feedback is particularly powerful for improving students' deep processing and mastery of tasks and directing students towards more effective task strategies. It provides a deeper understanding of learning, enabling students to appreciate relationships between strategies and performance, which helps them to transfer skills to more difficult or unfamiliar tasks.

Process-level feedback on metacognitive processes might focus on enhancing students' self-efficacy, self-regulatory skills or confidence to engage further on a task.

Example: *"You already know the key features for introducing an argument, check to see that you have incorporated them into your first paragraph."*

Feedback focused on cognitive or metacognitive processes is most effective when there is a delay between student performance and feedback, which enables better reflection.

3: Personal-level feedback

Feedback focused on the personal level is directed to the self and contains little task-related information.

Example: "That's an intelligent response, well done."

1. Feedback and student perceptions of feedback

2. Feedback and students' self-efficacy

3. Feedback and students' motivation

Summary:

Feedback that is designed to move students from the task to the underlying processes or understandings and then to self-regulation is most effective.

For example, feedback based at task performance can build students' confidence and help them to feel more able to improve and experiment with strategy use.

Then questioning and feedback can focus on learning strategies and meta-cognitive skills, which eventually help students to become self-regulating learners.

These are the students that seek and give their own feedback!

- **Selection of Right Assessment Method/s for our own Course-**

1

Engagement
with the task

2

Engagement
with learners'
belief about
the significance
of expending
effort to reach
the goals

3

Engagement
with learners'
self-conception
about
achieving
the desired
learning goals

1

Avoid the
risks involved
in handling
challenging
assignments

2

Minimize
effort to reach
the desired
learning goals

• Key features of effective evaluation

- Alignment
- Validity
- Reliability
- Transparency
- **Alignment**

There should be alignment between:

- clear and realistic learning outcomes
- learning opportunities to achieve these outcomes
- evaluation methods and tasks related to the learning outcomes and methods of learning

• **Validity**

- Evaluation should measure what it sets out to measure:
- This is typically pointed out during the preconference between the teacher and the administrator

Components of an Effective Evaluation

• Reliability and Transparency-

• Reliability

- Evaluation should be consistent and fair:
- good assessor reliability – administrator with classroom experience preferably.

• Transparency

- No 'hidden agendas' or surprises for teachers:
- Teachers should not have to guess what is in the assessor's mind.
- evaluation should be clearly aligned to published learning outcomes or a teacher personal improvement plan (PIP).
- The difference between formative and summative-
- The value of formative evaluation must express with the distinction to students in language they can grasp;
- Formative evaluation is the process of judging an ongoing, changing process or diagnosis, revision, description, information, or comparison

- Summative evaluation is a **final-end decision serving purposes of persuasion, verification, prediction** or validity
- Where there is no formative evaluation, by definition, the student learns nothing after submitting the work
- While formative evaluation highlights areas that need improvement or remediation
- Formative test results may lead to conclusions that other methods would be more effective.
- preferably **educators should incorporate both types of evaluation in program development.**

Formative vs. Summative Assessment

• Summary-

- Student skill, knowledge, and ability are best measured with assessment processes grounded in psychological science with well-defined standards for quality and fairness.
- Formative and summative assessments need to be evaluated for both reliability and validity.
- Instructors can improve the reliability and validity of formative and summative assessments by aligning them to learning targets, utilizing item analysis, discussing the results with other educators, and monitoring outcomes for discrepancies across groups or subgroups of students.
- Making sense of assessment data depends on clear, appropriate and fair interpretation.
- Effective teaching requires that instructors be able to accurately interpret test results and clearly communicate the results to students and parents.
- Students can use what they learn about testing and statistics to evaluate the various assessments given in class for reliability and validity.
- Discussions of descriptive statistics are more meaningful when students examine their own assessments.

✓ How to Learn More Effectively-

- Find ways to boost your memory
- Always keep learning new things
- Use a variety of learning techniques
- Try teaching it to someone else
- Connect new information to things you already know
- Look for opportunities to have hands-on experiences
- Remember that mistakes are part of the process
- Study a little bit every day
- Test yourself
- Focus on one thing at a time
- Stop Multitasking
- Utilize Mnemonic Devices
- Visualize Concepts
- Relate New Information to Things You Already Know

THANK YOU
